# A CATALOGUE OF BIRDS,

Sc.

VOLUME I.

COX AND WYMAN.

Printers to the Sion. East India Company,
CREAT QUEEN STREET, LONDON.

## INTRODUCTORY REMARKS.

The Zoological Museum of the East-India Company consists of specimens in all departments of the Science, from the Company's Oriental possessions, contributed by public servants who have been attached as Naturalists to Missions and Deputations on behalf of the Indian Government, or by gentlemen of the civil and military services as presents to the Honourable Court of Directors.

Collections and Contributions in the particular branch of Ornstruorous, have been received in the Museum in the following chronological order:—

- 1802. Eudelin de Jonville.—A series of Drawings of Birds from Cevlon.
- 1808. Francis (Buchanan) Hamilton, M.D.—Drawings of Birds from Continental India.
  - John Fleming, Esq.—Drawings of Birds.
- 1812. Richard Parry, Esq.—Drawings of Birds from Sumatra.

  The King of Tanjore.—Drawings of Birds from Southern
  India. Presented by John Torin, Esq.
- 1813. Hon. Thomas S. Raffles, Lieutenant-Governor of Java. —

  Specimens of preserved Birds from Java: Horsfield's Collection.
- 1817. Hon. Thomas S. Raffles.—Preserved Birds from Java: Horsfield's Collection.
  - Francis (Buchanan) Hamilton, M.D.—Drawings of Birds.
- 1819. Francis (Buchanan) Hamilton, M.D.—Drawings of Birds. Thomas Horsfield, M.D.—A large Collection of preserved Birds from Java, with Drawings.

- 1820. Sir Thomas S. Ruffles, Lieutenant-Governor of Fort Mark-borough.—A Collection of Birds from Sumatra.
- 1821. Sir T. S. Roffles.—Drawings of Birds from Sumatra.
- 1823. George Finlayson, Esq., Surgeon and Naturalist to the Mission of John Crawford, Esq., to Siam and Huć, the Capital of Cochin-China.—A Collection of preserved Birds, made during the Mission.
- 1824. Lieut.-General Thomas Hardwicke.—A Collection of Birds.
- 1827. Captain J. D. Herbert.—Specimens of Himalayan Birds, collected during his Geological Survey of the Himalayan Mountains.
- 1829. Mailras Government,—A Collection of Birds, made by the Company's Naturalist at Fort St. George.
- 1831. Colonel W. H. Sykes. A large Collection of Birds, made during the Statistical Survey of the Dukhun.
- 1832. Nathaniel Wallich, M.D.—Preserved Birds from Nepal.
- 1833. John Reeves, Esq.—A Collection of preserved Birds from China, with specimens of Edible Birds'-nests.
- 1837. John McClelland, Esq., Member of the Deputation to Assam for the purpose of investigating the Culture of the Tea Plant.
  —Specimens of Birds, with Drawings and Descriptions.
- 1840. John William Helfer, M.D.—A Collection of Birds from the Coast of Tenasserim.
  - Major R. Boileau Pemberton.—Specimens of Birds, collected during his Mission to Bootan in 1837-38.
- 1841. The Asiatic Society of Benyal.—A Collection of preserved Birds.
  - John McClelland, Esq.—Specimens of Birds.
- 1842. J. T. Pearson, Esq.—Specimens of Birds.
  - The Bengel Government.—A Collection of Birds made by W. Griffith, Esq., during the Expedition to Afghanistan.
- 1843. John McClelland, Esq.—A Collection of Birds.
  - The Bengal Government.—Birds collected by W. Griffith, Esq., during the Expedition to Afghanistan. Second Dispatch.
  - Hugh Falconer, M.D.—A Collection of Birds from N. India. William Griffith, Esq.—Specimens of Birds.
  - The Bombay Government,—The Collection of Birds made during the Mission of Sir W. C. Harris to Abyssinia.

- 1844. The Asiatic Society of Bengal.—Large Collections of preserved Birds, received by several separate dispatches.
- 1845. B. H. Hodgson, Esq.—A large Collection of Birds from Nepal. Matthew Lovell, Esq., Bengal Medical Service.—-Several Birds.
  - J. Bax, Esq., through Colonel Barnwell.—A Collection of Birds.
- 1846. The Asiatic Society of Bengal.—Large Collections of Birds, received by several separate dispatches.
- 1847. The Asiatic Society of Bengal.—A Collection of Birds. The Rev. F. W. Hope.—Several Birds.
- 1848. B. H. Hodgson, Esq.—Several Birds from Sikim and Darjeeling.
- 1850. Captain Richard Strackey.—A large Collection of Birds from Ladakh and Kumaon.
- 1851. The Bombay Government.—Specimens of Birds, received from Commander Jones, of the Indian Navy.
  - W. E. Wood, Esq., Hon. E.L.C. Medical Service. A specimen of the Adjutant or Gigantic Crane.
- 1853. B. H. Hodyson, Esq.—A large Collection of Birds from Nepal and Tibet.
  - John Gould, Esq.—Several specimens of Birds, desiderata to the Hon. Company's Museum.
- 1854. Captain R. C. Tytler, Bengal Army.—Several Specimens of Birds from Dacca.
  - Theodore Cantor, M.D.—A large Collection of Birds, from Penang and the Indian Archipelago.

The Systematic arrangement of this Catalogue is founded on the plan elaborated with great perspicacity and crudition by Nicholas Aylward Vigors, Esq., in an Essay, printed in the fourteenth volume of the "Transactions of the Linnean Society," p. 395, &c., entitled "Observations on the Natural Affinities that connect the Orders and Families of Birds."

In this Essay the entire Class of Birds is divided into five primary subdivisions, namely, Raptores, Insessores, Rasores, Grallatores, and Natatores. That part of the Catalogue now printed comprises only the Raptores and part of the Insessores; and an Analysis of the whole Class is reserved for the completion of this work. In the subdivision of families some modifications have been required, in consequence of newly-discovered forms, and in the second family of the Raptores, the Falconidæ, the subdivision of Dr. J. J. Kaup, in an Essay, "Ueber Falken, Museum Senckenbergianum," vol. III. (1845), has been adopted. In the Catalogue of the Mammalia contained in the Company's Museum, an analogous subdivision of the Class into the Orders of Primates, Feræ, Cete, Glires, and Ungulata, according to the systematic arrangement propounded by Dr. J. E. Gray in the introduction to the Catalogue of the Mammalia in the British Museum, has been employed.

Respecting the Nomenclature of this Catalogue, it may be stated, that it has been the uniform practice to assign to each species the latest and most authentic systematic name founded on a most careful research; and in many cases the numerous synonyms exhibit an interesting history of the changes which the nomenclature has experienced. The discoveries and additions of later years have required a nomenclature adapted to the present condition of the science. The Genera of the older Ornithologists have in most cases received numerous subdivisions, and many new Genera have been established. This has also been the case respecting Families. Such new Genera only as have been distinctly defined and described have been admitted into this Catalogue. With regard to specific names, it has been the invariable rule to preserve to the discoverer or first describer the credit which is due to him, and to indicate his right of priority by the terminal affix of  $S\rho$ , according to the pertinent and equitable recommendation of a Committee appointed in 1844, by the British Association of Science, "to consider the rules by which the Nomenclature of Zoology may be established on a uniform and permanent basis."

In collecting the notices of the habits and manners of the birds described, and in verifying the numerous synonyms scattered through various works on Zoology, Mr. F. Moore, the Assistant in the Museum, has laboured with great care and assiduity, as well as in expediting the preparation and printing of this Catalogue.

THOMAS HORSFIELD.

MULLA-GIDH (Priest-Vulture), Hind., Blyth.

LAL-MATA SHUKUNI (Red-headed Vulture), Beng., Blyth Sokuni, Mongopur, Dr. F. (B.) Hamilton.\*

RAJ SOGON OF RAJ GIDH, Bhagulpore, id.

A. Dukhun. Presented by Colonel Sykes.

b. Darjeeling. Presented by J. T. Pearson, Esq.

Colonel Sykes states of this bird, "mostly solitary, and seldom, if ever, saw more than two together."—(P. Z. S., 1832, p. 77.) "Two, or three may, however, be found hunting together, over high, rocky, and bushy hills."—(Jerd., Madr. J. L. S. X. p. 64.) Mr. Blyth asserts "that this species is only seen singly or in pairs, never in flocks. Upon one of these descending on a carcase whereon a crowd of V. bengalenses were gorging, these all make way for it, and keep aloof till it is gone (so, at least, I have repeatedly been informed); whence it currently bears the name of King Vulture amongst our countrymen."—(Ann. Nat. Hist. XII. p. 93.)

<sup>\* &</sup>quot;In Bengal, two kinds of Vulture, nearly of the same size and exactly of the same manners, are very common. They build in very tall trees and feed on carrion; when full they are lazy and inactive, and every motion when on the ground is awkward. They move from one place to another by hopping, which they perform with so much difficulty that they often expand their wings to enable them to move faster. They take wing with great difficulty, but when once raised into the air they fly very high, and soar with great facility. Their scream is very disagreeable, and both species are equally vile and abominable, being covered with

#### 3. OTOGYPS AURICULARIS, Daud. Sp.

Vultur aurieularis, Daud., Tr. d'Orn. II. p. 10. Le Vaill., Ois. d'Afr. t. 9. Bonap., C. G. Av. p. 10.

VULTUR, Keyserling et Blasius.

#### 4. GYPS FULVUS, Gmel. Sp.

Vultur fulvus, Gmel., S. N. L. I. p. 249. Lath., Hist. I. p. 17. Yarrell, Brit. B. I. p. 1.

Gyps fulvus, G. R. Gray, Gen. of Birds, I. p. 6; Cat. B. Brit. Mus. p. 6. Hodgs., Cat. B. Nep. p. 37. Blyth, Cat. B. Mus. A. S. Beng. p. 32. Bonap., C. G. Av. p. 10.

? Vultur Kolbii, Daud., Tr. d'Orn. I. p. 15. The Fulvous Vulture, Lath.

- A. Assam. From William Griffith's Collection.
- B. Kumaon. From Captain R. Strachey's Collection.

dirt and vermin. As no one disturbs them, they are not shy, but are cowardly birds, giving way to dogs, jackals, and even crows. Among themselves when about prey, they have constant squabbles,—screaming and hissing at each other, but they do not fight."—(Extract from Dr. F. (Buchanan) Hamilton's Notes on Indian Birds.) The two kinds of Vulture above referred to by Dr. F. (B.) Hamilton are Gyps (Vultur) bengalensis of Gmelin, the Changoun of Vieillot and Le Vailllant, and the Otogyps (Vultur) calvus of Scopoli, the Vultur pondicarianus of authors. Dr. Hamilton confirms Mr. Blyth's statement above mentioned, that the Changoun always pays the other the compliment of allowing it to eat first, on which account, in the Hindi language, the last is called Raj Sogon or Raj Gidh, for Raj signifies Royal; and the Changoun in that language is called simply Sogon or Gidh. Changoun or Soyon is nothing else than the Sanskrit Sakun, a bird in general. Raj-Sakun is the King-bird. Gidh is the vernacular form of the Sanskrit Gridhra, a Vulture; Raj Gidh, therefore, is the King-Vulture.

#### 5. GYPS VULGARIS, Savigny.

Gyps vulgaris, Sav., Descr. de l'Egyp. H. N. I. p. 71. Bonap., C. G. Av. p. 10.

Vultur Rüppelii, Natterer, Mus. Vindob.

Vultur fulvus Rüppelii, Schlegel.

Gyps fulvus, apud Gray et Blyth.

A. b. Abyssinia. From Sir W. Harris's Collection.

### 6. GYPS INDICUS, Scop. Sp.

Vultur indicus, Scop., Del. Flor. et Faun. p. 85. Temm., Pl. Col. 26. Sykes, P. Z. S. (1832) p. 77.

Gyps indieus, Blyth, Cat. B. Mus. A. S. Beng. p. 33.
Bonap., C. G. Av. p. 10.

The Indian Vulture, Lath.

MAHAH DHOH of the Mahrattas, Sykes.

GEEDH OF GIDH, Hind.

A. Dukhun. Presented by Colonel Sykes.

b. c. Nepal. Presented by B. H. Hodgson, Esq.

"These vultures congregate in flocks of twenty or thirty. On a dead camel, or horse, or bullock, being thrown out on the plain, numbers of them are found assembled round it in an incredibly short time, although they may not have been seen in the neighbourhood for weeks before. The proportional length of the intestine to the body of these birds, is three to one."—(Sykes, P. Z. S., 1832, p. 77.)

### 7. GYPS BENGALENSIS, Gmel. Sp.

### A. B. Dukhun. Presented by Colonel Sykes.

"The Bengal Vulture is a gregarious bird, to the full extent of the word, not only flying and feeding in flocks, but also building its nest in company." Lieutenant Hutton gives the following remarks on the nest and young of this yulture :- "On the 8th December, 1833, I found four vultures' nests in a large barkat-tree, near the village of Futtehgurh, on the road from Neemuch to Mhow. These nests were of great thickness, and were constructed of small branches and twigs, mixed with dead leaves; three of them contained one egg each, of a large size, and quite white. The fourth nest was occupied by a. solitary young one, just hatched, and thinly clad, or rather sprinkled over with a short down of an ashy colour. Near this tree were two others, on each of which were three or four similar nests; but as they were difficult of access, I did not ascertain their contents. Deeming the little one too young to take from the nest, I ordered my servant, who had climbed the tree, to leave it there, and on the 21st of the same month I returned to the spot, and finding the bird still in the nest, made a prize of it, and bore it away to my tent. The old vultures offered not the slightest resistance, but sat stupidly watching the robbery we were committing. On offering the young vulture raw meat, it fed greedily, and gave me reason to believe that it would be no difficult task to rear it, since it proved willing enough to feed. I was much surprised to see the little progress it had made in growth and plumage since I discovered it, a period of thirteen days, in which time most of the smaller birds would have been nearly ready to leave the nest, whilst my gluttonous friend had not even the smallest symptom of a feather. The whole bird was clothed with a light cinercous down, except on the neck, where it was partly bare, being in patches. It had no power to stand on its legs, owing to the great weight of the body. After feeding, or when hungry, it emitted a fractious peevish cry, like a sleepy child. When about three weeks old, the pale cinereous down gave place to one of a much darker colour, the head alone retaining its first clothing. month old, or thirty-three days from the time I first discovered it, the prime and secondary quills, greater wing-coverts, scapulars, tail feathers, and a few feathers on the upper part of the back, near the neck, made their appearance; but their growth was extremely slow,

being very little advanced four or five days after. The bird was still unable to stand, for although its strength had increased, the weight and increase of bulk of the body still rendered its legs of no use. Once or twice, on placing it on the ground, it swallowed several large stones, about the size of a sparrow's egg; and these I found voided three days afterwards, in the basket which served him for a nest. In a week's time the prime quills grew to an inch and a half long. The size of the body increased rapidly, and the bird supported itself on the knee-joints, but could not yet stand at forty days old. Its appetite became now no easy matter to satisfy, a pound of flesh at a meal being thought nothing of. At six weeks old the ruff round the neck was clearly discervible, and the quills of the wings were about three inches long. The top and hind part of the head began also to lose the soft thick down which had hitherto clothed it, and presented a naked bluish skin. On the 20th January it stood upright for the first time, being about forty-three or forty-four days old. At two months old it became completely fledged. It was now so tame as to become a perfect nuisance; for no sooner did it see any person than it ran towards them screaming and flapping its long wings, with the head bent low, and neck drawn in towards the body, often pecking at the feet of the person thus intercepted. Many were the thumps and kicks the luckless bird received from the servants, who most cordially hated him, as their bare feet were often assailed and cut with the sharp blows of his curved beak. through good and evil, he remained with us, roosting at night sometimes on the top of my bungalow, and at others wandering to some of the neighbours.' Often did I wish that he would take unto himself the wings of the morn and fice away; for he never entered the house without making it so offensive as to be scarcely bearable. having brought the evil upon myself, I was bound to bear it with patience; and at length, when I almost began to despair of ever getting rid of him, he deserted his usual haunts on the 10th May, being then five months old, and I never saw it afterwards."-(Journ. A. S. B. VI. p. 112.)

A. Dukhun. Presented by Col. Sykes.

B. c. Abyssinia. From Sir W. Harris's Collection.

d. Kumaon. From Captain R. Strachey's Collection.

Colonel Sykes informs us "that these birds are always found in cantonments and camps. For the most part of the day they continue on the wing, soaring in circles. When on the ground, they walk with a peculiar gait, lifting their legs very high. They are efficient scavengers. The proportional length of the intestine to the body in these birds is 5·20 to 1."—(P. Z. S., 1832, p. 78.) Bruce says, "The Rachamah has no voice that ever 1 heard; generally sits single, and oftener sits and walks upon the ground than upon trees. It delights in the most putrid and stinking kind of carrion, and has itself a very strong smell, and putrefies very speedily. It is a very great breach of order or police to kill any one of these birds near Cairo. It lays but two eggs, and builds its nest in the most desert part of the country."—(Travels, App. p. 266.)

"These birds light in great flocks on the lay-stalls near the city of Cairo, and there promisenously feed, with the dogs and other beasts, on dead carcases and other offal. They assemble with the kites every morning and evening, in the square called Rohneli (which is the place for executing capital offenders), there to receive the alms of fresh meat, left them by the legacies of wealthy great men. The appearance of the bird is as horrid as can well be imagined, viz.: the face is naked and wrinkled, the eyes are large and black, the beak black and hooked, the talons large, and extended ready for prey, and the whole body polluted with filth: these are qualities enough to make the beholder shudder with horror. Notwithstanding this, the inhabitants of Egypt cannot be thankful enough to

Providence for this bird. All the places round Cairo are filled with the dead bodies of asses and camels; and thousands of these birds fly about and devour the carcases, before they putrefy and fill the air with noxious exhalations. The inhabitants of Egypt, and after them Maillet, in his description of Egypt, say, that they yearly follow the caravan to Mecca, and devour the filth of the slaughtered beasts and the carcases of the camels which die on the way; but I have not been an eyewitness of this. They do not fly high, nor are they afraid of men. If one is killed, all the rest surround him, in the same manner as do the Royston crows; they do not quit the places they frequent, though frightened by the explosion of a gun, but immediately return thither. The Arabians call it Rochæme."—(Hasselquist, Travels in the Levant, p. 194.)

#### A. Abyssinia. From Sir W. Harris's Collection.

The Indian vultures exhibit in their habits and mode of life all the characteristic features which have been observed of this family in other countries. They feed almost exclusively on carrion and putrid animal matter, and they render most useful services to other living beings, by removing offensive substances and purifying the air. Their external form is lax and disgusting, and they sit in a slouching attitude, scarcely resembling living creatures. Their claws are proportionally small, their feet formed more for sitting than prehension; they are destitute of the means of attack and defence possessed by eagles and other rapacious birds, and they consume their food on the spot, and having filled their capacious craw, they carry the contents to their nests to feed the young. Their bill is large, strong, and of greater height than breadth. The head and neck are generally naked, or covered with a short down, and the neck is often long and slender. Although they live in solitary pairs, they assemble in large numbers whenever a dead body is discovered by them. They form their eyries on inaccessible rocks or on high trees. Their flight,

although slow and tortuous, enables them to ascend to prodigious heights, to which the eye cannot follow them; from which they descend on the objects of their attraction in a similar manner. Their organs of smell and of sight are extremely perfect. They never attack living animals, and except when employed in feeding on a dead carcase, the smallest animal can put them to flight.

The genus Gypaëtus, Vulture-Eagle, forms a natural connecting link between the Vultures and the true Raptorial birds. In its general attitude, the loose plumage on the head, the form of the beak, the structure of the claws, and especially in the habit of occasionally feeding on carrion or dead animal matter, it agrees with the Vultures: while in its inherent boldness of character, and in its raptorial disposition, it approaches the true Falcons and Eagles. The most favourite food of the Gypaëtus is obtained by the chase: it attacks and carries off small quadrupeds of every description, lambs (hence Lämmergeyer in German), wild goats, mountain hares, young deer, calves, &c. Oken mentions several authentic cases of its having carried off children in the mountainous parts of Switzerland, and Lieutenant Fisher informed Bishop Heber that the same feat had occurred in the streets of Almorah.

- A. Kumaon (with dark gorget across the breast). From Captain R. Strachey's Collection.
- B. C. Abyssinia (with black head). From Sir W. Harris's Collection.

The variations which this bird exhibits in its external covering, as it occurs in northern Europe, Africa, and India, have given rise to different specific denominations, according to its local peculiarities in the countries mentioned. Gypaëtus barbatus exhibits pre-eminently its European form; Gypaëtus hemachalanus of Hutton that of India; and Gypaëtus meridionalis of Keyserling and Blasius that of Africa. Whether the characterson which these separations are founded amount to real specific distinctions, or whether they merely indicate local variations, is still a matter of difference of opinion among naturalists. The distinguishing character of the Indian form is, according to Hutton, a deep brown or black band across the orange feathers of the breast, forming a well-marked collar or gorget (Hutton, Journ. A. S. Beng. Vol. III. p. 523; VII. p. 23); but this is not admitted to be a specific distinction by Hodgson (Journ. A. S. Beng. IV. p. 458). The peculiarity of the African form is indicated by Rüppell in the following diagnosis: - "Diag. Gypaëtus speciei Europææ (G. barbato) persimilis, a qua differt regione anguli oris et suboculari

plumulis lanuginosis albis, tarsis parte inferiore et interna plumis devestita."

But even in specimens from the same locality, the external covering varies considerably, according to sex or age; in young subjects the head and neck are brown or black.—(Journ. A. S. B. VII. p. 24.) A very full and comprehensive account, as well of the external covering and occasional local differences, as of the habits of this bird, is given by the late E. T. Bennett, Esq., in his work, "The Gardens and Menagerie of the Zoological Society," from an individual which lived a considerable time in the gardens: the details given by Mr. Bennett are confirmed by several Indian naturalists. In the fourth volume of the Journ. A. S. Beng. p. 455, Mr. Hodgson states,-"The manners of this bird are decidedly more vulturine than aquiline. Ordinarily, he is met with in groups, or pairs, or singly, without marked distinctions of habits in that respect; but the prospect of an abundant repast is sure to collect numbers of the species, too voraciously intent upon satisfying the cravings of an appetite dependent for its gratification upon contingencies, to admit of their betraying any of that shyness of man which the aquiline race invariably manifest. If the flesh-pots be exposed at Simla, or Massuri, or elsewhere in the western hills, it becomes necessary to keep a good watch upon them, lest the bearded vulture steal a share of the contents; and the offals and carrion-carcases, freely abandoned to him by our European soldiery, and by the peasantry, he rushes to devour, almost heedless of the neighbourhood of human kind." Lieutenant Hutton's account (Journ. A. S. B. VII. p. 21) agrees with that of Mr. Hodgson.

Bishop Heber (Journey through Upper India, &c.) gives an account of an eagle of an extraordinary size which was shot by Lieutenant Fisher, near the Himalaya. It measured thirteen feet between the tips of its extended wings. From Lieutenant Fisher's description, it was doubtless an individual of the Gypaëtus barbatus. "This is no doubt the bird which carries away the children from the streets of Almorah." "It appears," the Bishop adds, "strongly to resemble the noble bird described by Bruce, under the name of Nisser, as common among the mountains of Abyssinia."—(Travels, vol. VII. Appendix, p. 255, fig. 31.) Two species of Nisser are mentioned by Bruce, the Nisser Werk (fig. 31) and the Nisser Tookoor (fig. 32). The first is distinguished by the name of Abou Duch'n or Father Long-Beard, of which the following story is related. "Upon the highest top of the mountain Lamalmon, while

my servants were eating their dinner in the outer air, with several large dishes of boiled goats'-flesh before them, this enemy, as he turned out to be to them, appeared suddenly. He did not stoop rapidly from a height, but came flying slowly along the ground, and sat down close to the meat, within the ring the men had made round it. A great shout being raised, the bird slowly retired, but he soon came up again, when he was shot a small distance from the party.'' Rüppell found the Gypaëtus on most of the high mountains of Abyssinia, chiefly in parties of three,—an old pair with a single young one. It is fully aware of its strength, and shows no fear on the approach of man. This bird is also described in Salt's "Travels," App. p. 41.

"A very common bird about Angollallah and Ankober (Abyssinia). It is not so timid as the solitary specimens of its family in Europe, it comes not into the compounds, but still it hovers about in the next vicinity of the towns and villages. Smells dreadfully from its mode of living. Takes a great quantity of water."—(Dr. Roth's MS. Report.)

- "Very abundant in the Dukhun. Both sexes are absolutely identical with the European birds in their characteristic plumage. The male bird, however, in one instance exactly resembled the female of the European Kestril, indicating a distinct species. Remains of rats, mice, lizards, grasshoppers, and a bird, were found in the stomach of several specimens."—(Sykes, P. Z. S. 1832, p. 80.) "The Kestril is

an extremely common bird, frequenting the open plains and bare rocky hills. Its chief food is lizards, large insects, and occasionally young birds. The male is occasionally as large as the female,"—(Jerd. Madr. J. L. S. X. p. 82.) Mr. Blyth has found this bird "very common in Lower Bengal, where he has frequently seen them in parties of twenty or thirty hunting over the cultivated lands. It breeds in April, in lofty trees, and also on the tops of minarets."—(Cat. B. Mus. A. S. Beng. p. 15.)

"It is not generally known that these tiny Falcons (which weigh but a few ounces) are trained for hawking in the Upper Provinces of India, being flown at quails and other game of corresponding size, as I have been informed by different eye-witnesses of the sport, which is thus described in Captain Mundy's 'Sketches of a Tour in India,' II. p. 25. 'We had also some amusing sport with another kind of Falcon, a very small bird, perhaps barely so large as a thrush, and its prey was proportioned to its strength. It is flown at quails, sparrows, and others of the like calibre. The mode of starting it is different from that used with any other hawk. The falconer holds the little well-drilled savage within the grasp of his hand, the head and tail protruding at either end, and the plumage carefully smoothed down. When he arrives within twenty or thirty yards of the quarry, the sportsman throws his hawk, much as he would a cricket-ball, in the direction of it. The little creature gains his wings in an instant, and strikes his game after the manner of the Bhause' (Astur palumbarius)."-(Blyth, J. A. S. B. XI. p. 789.)

"The Bhyree is found even in the hottest parts of the Peninsula. I obtained one alive at Trichinopoly, which was said to have fallen into a tank. Many are yearly captured about Ramnad and also in the Northern Circars. I shot a specimen on some rocks in the Sea of Tellicherry at the end of April, and it is tolerably abundant in the more northern parts of the Deccan, as near Jaulnah, occasionally coming into cantonment, and carrying off chickens, &c. Walter Elliot, Esq., in his 'Notes,' says, 'It is migratory, appearing on the eastern shores of the Peninsula in September or October, and remaining till March or April, when it disappears for the purpose of breeding and moulting.' Great numbers are caught every year in the Northern Circars by a caste named Yerklees, and sold to the falconers of Hyderabad, Kurnool, &c., at an average of ten rupees each. The falconers distinguish three kinds, the black, the red, and the white, according to the shades in their plumage. The Bhyree affects, in general, open country, rocky hills, and deep valleys where brushwood abounds; also frequents tanks, and preys much on paddybirds, ducks, and water-fowl. It is more esteemed for its courage and powers of flight than either of the other two large falcons found in this country."—(Jerdon, Madr. J. L. S. X. p. 23.)

Sir T. Stamford Raffles states, "this Falcon is in high estimation among the Malays, who consider it as the prince of birds, and have frequent allusions to it in their poetry."—(Trans. Linn. Soc. XIII. p. 278.)

d. e. f. Drawings. King of Tanjore's. From J. Torin, Esq.

"The Shaheen appears to be spread throughout the whole of India, from the Himalayas to the extreme south of the Peninsula. It is far from being a common bird. It is, however, well known to the native falconers, who have from time immemorial been acquainted both with its breeding-places and its most favourite haunts. The habitual resorts of this Falcon are high rocky hills in the neighbourhood of jungle and forest land, whether in a low or mountainous country, though the latter is always preferred. In the Carnatic, which is nearly devoid of forest, the Shaheen is but seldom met with, yet there are certain spots even here where individuals of the species resort to after the breeding season, being chiefly young birds; and they are known to breed in various parts of the range of Eastern Ghauts. Its habits in a wild state vary somewhat according to the kind of country frequented. If a denizen of a forest, it watches on some lofty tree at the skirts of a glade, or hovers over it, ready to pounce on any unlucky bird that ventures to cross. In more open

country it is necessitated to take a wider circuit in search of its prey, and is of course much more on the wing. Such birds are more highly prized for training than forest-bred birds, which are, therefore, seldom sought for. This Falcon destroys large quantities of game, partridges, quails, &c., and it is said to be very partial to paroquets. This assertion is corroborated by the fact of my having first obtained a specimen of the rare Alexandrine Paroquet by the agency of a Shaheen, which pounced on a flock that was crossing a glade of a forest in Malabar, and carried one off, but dropped it on my firing at it. One belonging to me, having lost a partridge at which it was flown, took a long flight after some paroquets it spied high up in the air. One I shot in Travancore, just after sunset, was busily devouring a Goatsucker (Caprimulgus) it had captured.

The Shaheen breeds on steep and inaccessible cliffs. I have seen two eyries, the one on the Neelgherries, and the other at the celebrated hill-fort of Untoor. It lays its eggs in March and April, and the young fly in May and June, when they are caught by the falconers.

The Royal Falcon of the East (as its Indian name implies) is very highly prized by the natives for use in hawking, and it is esteemed the first of all the Falcons, or black-eyed birds of prey, as they are called in native works on falconry,—the large and powerful Bhyree (F. percgrinus) even being considered only second to it. Although hawking is now comparatively at a low ebb in India, yet many individuals of this species are annually captured in various parts of the Peninsula, and taken for sale at Hydrabad and other places where the noble sport of falconry is yet carried on, and they sell for a considerable price. The Shahcen and other Falcons are usually caught by what is called the Ecrwan. This is a thin strip of cane of a length about equal to the expanse of wings of the bird sought for. The ends of the stick are smeared with birdlime for several inches, and a living bird is tied to the centre of it. observing the hawk, the bird, which has its eyes sewn up to make it soar, is let loose, and the Falcon pounces on it and attempts to carry it off, when the ends of its wings strike the limed twig, and it falls to the ground. The birds usually selected for this purpose are doves, either Turtur risorius or T. humilis.

The Shaheen is always trained for what in the language of falconry is called a standing-gait, that is, is not slipped from the hand at the quarry, but made to hover and circle high in the air over the falconer and party, and when the game is started it then makes

its swoop, which it does with amazing speed. It is, indeed, a fine sight to see this fine bird stoop on a partridge or florikin (Otis aurita) which has been flushed at some considerable distance from it, as it often makes a wide circuit round the party. As soon as the Falcon observes the game which has been flushed, it makes two or three onward plunges in its direction, and then darts down obliquely with half-closed wings on the devoted quarry, with more than the velocity of an arrow. This is, of course, a sure and deadly way of hunting, and though infinitely more exciting than the flight of shortwinged hawks, is certainly not to be compared in interest to the flight of a Bhyree from the hand after the heron, or the Douk (Tuntalus leucocephalus). The Shaheen is usually trained to stoop at partridges and florikin, also occasionally at the stone plover (Edicnemus crevitans) and the jungle-fowl. It will not hover in the air so long as the Luggur, which, being of a more patient and docile disposition, will stay up above an hour.

In the works I have before alluded to, the name Shaheen is said to be that by which it is known in Persia, as well as among the Mussulmen of India, Kohce being the name given it by the Hindoos of the north of India, whence, in all probability, comes the name of the male bird in general use, viz. Koela of Kohela, though it is said to be called Shaheen Bucha in Persia. It is said to bear the name of Laheen in Toorkistan, and Kubursh in Arabic. Among the localities for it given in the native works on falconry are Koordistan, Khorasan, Moultan, and Cabul. Several varieties are enumerated; viz. the red, the white, the blue, and the black; but these are merely shades of difference in the colours, and in the more or less distinctness of the markings. These variations, however, are very considerable in this Falcon, as well as in the Peregrines found in India, and are probably in some measure owing to the long domestication, if I may so speak, of these birds, as it is well known that birds moulting in confinement vary somewhat in the shades of their plumage from those subject to the more vigorous actions of a wild state of life."—(Jerd. Ill. Ind. Orn.)

#### 21. FALCO JUGGER, J. E. Gray.

- e. Drawing. From Dr. F. (B.) Hamilton's Collection.
- f. Drawing. Siam. From Finlayson's Collection.
- g. h. Drawings. King of Tanjore's. From J. Torin, Esq.

"The Juggur is the most common of the large Falcons of India, and is a bird of a heavier and slower flight than any of the other Falcons of this country, and is held in less estimation by the natives."—(Jerd. Madr. J. X. p. 80.) "Whilst the Bhyree (F. peregrinus) prefers the sea-coast and the neighbourhood of lakes, rivers, and wet cultivation, and the Shaheen (F. peregrinator) delights in hilly and wooded regions, the Luggur, on the contrary, frequents open dry plains and vicinity of cultivation. It makes its nest in some lefty tree, generally one standing alone among some grain-fields, and lays four eggs. In a wild state it preys on a great variety of small birds, often snatching up a chicken, even in the midst of a cantonment. It is trained to hunt crows, paddy-birds, partridges, and florikin, and it is said has been trained to kill the heron (A. cinerea).

In hawking crows, (C. culminatus) chiefly, it is slipped from the hand, and the crow, when aware of its danger, uses every artifice to escape, taking refuge among cattle, horses, vehicles, and even entering houses. I once had a Luggur whose wing feathers were burnt off by a washerman's fire, close to which the crow was attempting to take refuge when it was struck. After paddy-birds (Ardea bubulcus) it is also slipped from the hand, and as this bird is always found on the plains feeding among herds of cattle, it affords considerable sport by its dexterity in diving among and under the cattle, and the ven-

turous hawk is occasionally trodden under the feet of the cattle. When the quarry is a partridge or a florikin, the standing-gait is used, as described under the head of the Shaheen. Luggurs as well as Shaheens are always caught after they have left the nest and have had some instruction by their parents, the native falconers considering them better than when taken from the nest, contrary, I believe, to the opinion of our English Adam Woodcocks. The Luggur appears to inhabit the whole continent of India."—(Jerdon, Ill. Ind. Orn.)

- e. Drawing. King of Tanjore's. From J. Torin, Esq.

"The Turoomtee frequents patches of wood or single trees in the open country, and even gardens. It is found in all parts of the Peninsula, and is a bird of great courage and activity, generally hunting in pairs, rising alternately over their prey, and sometimes following closely on the wing. I have seen it hover occasionally, though rarely. It preys chiefly on small birds. Walter Elliot says 'it will not suffer other birds to approach their perch, but drive away even the Wokhab (Aquila nævioides), hovering over him with shrill cries.' The Turoomtee is occasionally reclaimed and flown at small birds, especially at the common jay or roller (Coracias bengalensis), in pursuit of which much amusement is afforded from the clumsy evolutions and harsh cries of the quarry."—(Jerdon, Madr. J. L. S. X. p. 82.) Colonel Sykes "found a sparrow in the stomach of a male bird, and a young bat in that of another."—(Sykes, P. Z. S. 1832, p. 80.)

- b. Himalaya. Presented by Dr. Falconer.
- c. Nepal. Presented by B. H. Hodgson, Esq.
- d. Afghanistan. From Griffith's Collection.
- e. Drawing. From Dr. F. (B.) Hamilton's Collection.

"Though generally spread over India, the Kupasee is by no means common. It is most frequent in woody districts. Its general food is insects (chiefly grasshoppers and locusts), lizards, and mice. I shot one in Goomsoor, which was devouring the carcass of a dove; this, however, appeared to have been dead some time, and I doubt if it was killed by the Kupasee. It often frequents long grass and grain-fields, over which it may be seen to hover like the Kestril."—(Jerd., Madr. Journ. L. S. X. p. 71.)

Mr. Hodgson gives the following notice of the manners of this bird. "The Chanwa, or Black-wing, quests chiefly in the morning and evening, feeding upon small birds, insects, and mice. It does not usually seize upon the wing, though its hunting be, for the most part, by continuous questing. Commonly, it is seen skimming the cultivation like a Circus, occasionally poising itself on the wing for the purpose of getting a distincter view of some mouse, small bird, or insect which has stirred on its beat, and upon which, when clearly perceived, it stoops perpendicularly with the speed of lightning. After a while, it will resort to some low roost, and, when relieved, commence another excursion, or, perchance, sit and watch there for its prey. Its forward flight is easy, low, and silent, but very effective in evolution when exertion is required to capture such nimble game as mice, which constitute its ordinary food. It frequently whips off insects from the stalks of standing grain, and this feat is, of course,

accomplished on the wing. I have also seen the Chanwa pursue cuckoos and sparrows with uncommon energy, but I never witnessed it strike a bird in the air. The Chanwa doubtless can, and sometimes does, seize its feathered prey on the wing."—(Madr. Journ. L. S. VI. p. 77.)

"This very useful bird is extremely numerous, more especially in cantonments, villages, and camps, and is continually on the look-out for refuse of every description. Colonel Sykes says, 'Constantly soaring in the air in circles, watching an opportunity to dart upon a chicken, upon refuse animal matter thrown out from the cookroom, and occasionally even having the hardihood to stoop at a dish of meat being carried from the cook-room to the house.'—(P. Z. S. (1832), p. 81.) Away from cantonments, it preys chiefly on reptiles; is also remarkably fond of fish, both fresh and dried. Has a very shrill cry or squeal."—(Jerd., Madr. J. L. S. X. p. 71.)

Mr. Blyth gives the following remarks on the habits of this bird. "It is not unusual to see a hundred or more circling in the air together about Calcutta, especially towards the evening, all collected about one spot, though there may be no refuse to entice them thither: or, if some garbage be thrown out, their dexterity at clutching whatever they can seize without alighting, a number of them rapidly following each other and descending thus in the most crowded streets, affords a curious spectacle. A few will generally alight and mingle among their fellow-scavengers the crows, while a crowd of others are circling and dashing over them, and stooping as they sweep by. In illustration of their boldness, I may mention that I once received a smart knock from the wing of one of these birds in a crowded bazaar, as it passed close to my shoulder from behind. The direct flight of this kite, when not sailing, is heavy and laboured, being relieved at intervals by gliding with motionless wings. Numbers may commonly be seen overhead buoyantly floating and gliding in easy curves, yet keeping much together, whether sailing high or low; and their descent upon any garbage is very rapid, and often spiral. They are decidedly social,

and many may daily be seen together sitting on a dead tree, or the parapet of a house, pruning and sunning themselves, while others are sailing about above them.

Their often-repeated cry is a tremulous shrill squeal (whence the native appellation, Cheele) resembling that of the British Kite. They subsist mainly on filth and refuse, but will readily pick up a chick or wounded bird, and I once knew one to kill a full-grown hen; this, however, was considered rather an anomalous occurrence; and they seem to be generally on excellent terms with the crows, though I have been told, and on good authority, that a kite will sometimes seize a crow, probably when pressed by hunger, albeit the uproarious clamour of all the crows in the neighbourhood, sure to collect on such an occasion, might suffice to deter him from doing so a second time. During the rainy season, the Kites totally leave Calcutta for three or four months, not, however, for breeding, for the young have then all flown."—(Ann. Nat. Hist. XII. p. 92.)

Dr. F. Buchanan Hamilton in his MS., remarks, "When full, it delights to sit on the entablatures of buildings, where it exposes its back to the hottest rays of the sun, placing its breast against the wall and stretching out its wings exactly as the Egyptian Hawk is represented on their monuments."

"The Besra is a comparatively rare Hawk, though well known, by name at least, to every native who takes an interest in hawking. Its permanent resorts are the large and lefty forests of Western India, and it is only after the breeding season is over, about July, that a few birds, usually young ones, straggle to various portions of the eastern parts of the Peninsula, and there only to districts more than usually wooded or jungly. Here they remain a few months and return again to the western forests for the purpose of breeding. Mr. Elliot says that he 'has only met with it in the Soonda jungles (in Canara), where it is taken young by a caste called Halapyks, and sold to falconers from Hyderabad.' I have reason to believe that several individuals are annually captured in certain districts on

the eastern coast, where from time immemorial they have been known to resort to on migrating from the western coast.

The Besra and other short-winged Hawks, as well as occasionally the Luggur and some of the Falcons, are usually caught by what is called among falconers the Do Guz. This is a small thin net from four to five feet long, and about three feet broad, stained of a dark colour, and fixed between two thin pieces of bamboo, by a cord on which it runs. The bamboos are fixed lightly in the ground, and a living bird is picketed about the middle of the net, and not quite a foot distant from it. The Hawk makes a dash at the bird, which it sees struggling at its tether, and in the keenness of its rush, either not observing the net from its dark colour, or not heeding it, dashes into it, the two side sticks give way, and the net folds round the bird so effectually as to keep it almost from fluttering.

The Besra is said to be somewhat more difficult to train than most of the Hawks, and it is a delicate bird and requires great care and attention, especially during the hot season. It is highly esteemed among native falconers, and sells for a considerable price. It is very speedy, and particularly active and clever in jungle, which its habits, as a denizen of the forests in its wild state, peculiarly fit it for. It is chiefly flown at the partridge, which it seizes in general with great ease and certainty; also occasionally at quails, snipes, and doves. The male, or Dhotee, is but seldom trained, and is then flown at sparrows, brahminy mynas (Pastor pagodarum), and other small birds."—(Jerdon, Ill. Ind. Orn.)

Mr. Jerdon remarks: "I have only hitherto seen the Teesa in the more northern portion of the Deccan, and it increases in number as

you advance to the northward. About Jaulnah, it is very numerous. It frequents topes as well as the open country, where it may be seen seated on low trees and bushes, an ant-hill, or the banks of rivers, whence it pounces on mice, lizards, small snakes, and various large insects and their larvæ. Mr. Elliot, in his 'Notes,' says, 'It is said to be fond of crabs. It certainly does not refuse them. I saw a Parsee catch one directly by baiting his springes or nooses with a crab.'

The flight of the Teesa is tolerably rapid, performed by repeated strokes of the wings, exactly like that of the Kestril, for which at a distance I have occasionally mistaken it. Its flight too in general is low. I have seen it several times take a much more extended flight than usual over a rumna, flying at a low elevation, and now and then rising slowly a few feet, and I observed it apparently capture a locust or some other insect on the wing."—(Madr. a. and Drawing (Sp. rufitinctus, McClell.). Assam. Presented by J. McClelland, Esq.

"It inhabits the banks of the Burhampooter and other rivers in Assam, where it conceals itself in bushes and grass, along the verge of the water, seizing such fishes as approach the surface within its reach."—(McClelland, Proc. Z. S. (1839), p. 154.)

Mr. Jerdon obtained a specimen of what he considered a young male Baz (Astur palumbarius), but which is identical with this species, "seated on a bough, in one of the thick woods of the Neilgherries close to Ootacamund. He several times afterwards observed a pair of apparently the same birds hunting together near Coonoor, where they had committed several depredations on some pigeons, and he one day saw them make an unsuccessful swoop at a flock of pigeons close to the house. Their flight was swift, similar to that of the sparrow-hawks, but at a considerable height, whence they made a sudden pounce."—(Madr. Journ. L. S. X. p. 85.)

The Tawny Eagle.

Wokпab, Hind., Jerd.

- A. Bengal. From Blagrave's Collection.
- B. Locality and Donor unknown.
- C. D. Abyssinia. From Sir W. Harris's Collection.
- e. N. India. Presented by the Asiatic Society of Bengal.

"The Wokhab is the most abundant Eagle in India. I have seen it both in the Carnatic, though more rarely, and on the table-land, where it is tolerably common. In the Carnatic it chiefly frequents hilly districts clad with low jungle. In the Deccan it frequents, by preference, the cultivated lands near villages. Till an hour or two after sumrise, it may be seen seated on the top of some tree, after which it sallies forth, sailing about at a moderate height in general (though it varies much in this respect) over the fields, valleys, and ravines, with a slow circling flight, or in company with the kites, like which, it is ever on the look-out; hovers over villages, towns, and cantonments. They prey upon hares (as I have ascertained, in one or two instances, from the contents of their stomach), and other

game, also rats, lizards, snakes, and insects; occasionally also pounce on an unwary bird, and in fact feed upon almost any kind of food, living or dead, which, however, they obtain perhaps, less by their own industry than by robbing other birds, kites, falcons, and other birds of prey. From Mr. Elliot's 'Notes' I extract the following: 'The Wokhab is very troublesome in hawking after the sun becomes hot, mistaking the jesses for some kind of prey, and pouncing on the falcon to seize it. I have once or twice nearly lost Shaheens in consequence, they flying to great distances from fear of the Wokhab.' A specimen I possessed alive, was not very particular as to its food. It frequently snatched morsels from a Golden Eagle I kept with it, to which the latter in general quietly submitted; it is a very noisy bird, frequently uttering a shrill scream, and has a great share of curiosity, walking up to, and carefully and thoroughly examining every new comer I place in the same apartment. It is apparently a very easily domesticated bird, and perhaps might be taught to hunt haves, &c."-(Jerd., Madr. Journ. L. S. X. p. 68.)

Large Hawk Eagle, Jerd.

MHORUNGAH OF MHORUNGEE, Hind., Jerd.

Salwa, Teloogoo, Jerd.

RAJALEE, Tamool, Jerd.

### a. b. Nepal. Presented by B. H. Hodgson, Esq.

"The Mhorungah is certainly a rare bird in southern India. I have only seen it twice, once in Baramalıl, seated on the edge of a tank in the neighbourhood of a jungly district, and again a pair seated on a lofty tree, in a tope in open country in the northern part of the Deccan. Mr. Hodgson says the habits of the genus are as follows: 'Preys on jungle-fowl, partridges, hares, watches from a lofty perch, usually pouncing on its game when near it, sometimes pursues with energy on the wing.' Mr. Elliot in his 'Notes' says: 'Is the noblest of the Indian Eagles, being seldom seen, and then generally at a great height in the air, in wild places. It preys on the hare. I once saw a pair of them hunting in company, which nearly surprised a peacock, pouncing on him on the ground."--(Jerd., Madr. J. L. S. X. p. 669.) "The large Hawk Eagle is dispersed over the whole continent of India from the Himalayas to Cape Comorin, but cannot be said to be an abundant species, though few districts are not occasionally frequented or visited by them. It chiefly affects the more wooded and jungly districts, and especially the neighbourhood of hills and mountain-ranges. It is much on the wing, sailing at a great height, and making its appearance at

certain spots in the district it frequents, always about the same hour. It may often be seen seated on the summit of a lofty tree, or on some overhanging rock. I have observed it chiefly on the Neilgherries, along the range of western and northern Ghauts, also though more sparingly in the bare Deccan and Carnatic. It preys by preference on various kinds of game, hares, jungle-fowl, purfowl, and partridges, and even on pea-fowl; also on ducks, herons, and other water-fowl, and according to the testimony of native Shikarees, it has been known to strike down the Douk (Tantalus leucocephalus). Most native falconers too, have stories to relate of its having carried off a favourite hawk. On one occasion on the Neilgherries, I observed it stoop successively at a spur-fowl, hare, and pea-fowl, each time unsuccessfully, however, owing to the thickness of the jungle. A pair were also wont to resort to a village at the hills and carry off fowls. Great havoe was committed among several pigconhouses on the Neilgherries by a pair of these eagles, and indeed I heard that one or two were completely devastated by them. manner in which they captured the pigeons was described to me by two or three eyewitnesses, to be as follows: on the pigeons taking flight, one of the eagles pounced down from a vast height on the flock, but directing its swoop rather under the pigeons than directly at them. Its mate, watching the moment when, alarmed by the first swoop, the pigeons rise in confusion, pounces unerringly on one of them, and carries it off. The other Eagle, having risen again, also makes another stoop, which is generally fatal. I have not yet been fortunate enough to meet with the nest of this Hawk Eagle, but it is said by native Shikarees to build on steep and inaccessible cliffs. and to breed in January and February."—(Jerd., 111. Ind. Orn.).

- A. Dukhun. Presented by Colonel Sykes.
- b. Nepal. Presented by B. H. Hodgson, Esq.
- c. Locality unknown.

Mr. Jerdon observes: "I several times saw birds of this species, both single and in pairs, in the more northern parts of the Deccan, many of which showed the white mark at the base of the tail, which gained for it the name of the ring-tailed Eagle, and I procured a specimen near the Godavery river; I frequently also saw them near Jaulnah, even close to the cantonment, and they are occasionally seen to pursue and strike at hares, florikin, and other game, started by sportsmen. This Eagle may generally be seen seated on the ground, or on a stone on the rocky hills, in the neighbourhood of Jaulnah,

whence, after the sun has been up for some time, it takes a flight in search of prey, at no great elevation, hunting slowly over the bushy valleys and ravines, and also over the cultivated ground occasionally; after which, if unsuccessful in its search, it reseats itself on a stone on some eminence, or even perches on a neighbouring tree, where it patiently waits till some quarry is raised or viewed, or till hunger again prompts it to take a flight. I obtained a specimen alive. It feeds most greedily on raw meat, preferring it to birds or animals, either dead or living. It is very sluggish and inactive, even when urged by hunger. It generally drinks a gulp or two of water after eating. The only cry I have heard it utter, is a harsh croaking."—(Madr. Journ. L. S. X. p. 66.)

"This species is very generally spread over the country. It affects chiefly the open plains and patches of cultivated ground. It may frequently be observed perched on a low tree, or even a bowrie pole, or scated on the bank of a river, whence it occasionally darts on its prey, but generally takes a long and lofty circling flight, or flies heavily along, but a few yards above the ground. The most favourite food of the Samp-mar is, as its Indian name implies, snakes. It will, however, take other food. Colonel Sykes found a rat in the stomach of one. I saw one strike at a wounded hare, and another make a swoop at a teal that was shot. From Mr. Elliot's 'Notes' I take the following: 'Pounces on suakes and guanas; my Meer Shikar has seen them on the ground with their claws on the snake's head, its body coiled round the bird's wings, in which state the herd-boys sometimes kill them. The Yerklees say it has a figure of the god Chukram under each wing, by which it prevents the snake going forward. In the stomach of one I found a snake, about two feet long, and a centipede." "The Jokowuru is found in Java, always near lakes, or on the banks of large rivers. It is by no means generally distributed. I met with it in two situations only,—one near the banks of the river of Kediri, in the eastern district, the other near the middle of the island, on the hills of Prowoto, about twenty miles south-east of

Semarang. Here a pair of these birds had established themselves for several years near a village on the confines of an extensive lake formed by the accumulation of water during the period of rains, and distinguished by the name of Rawa (lake) of Damak, nest was built on the top of a large tree, and was constructed in a rude manner of branches of trees,—the branches which were placed on the exterior were more than an inch in diameter,—the inside was lined with small twigs; it was irregularly round, and very slightly excavated. The birds were surprised during the period of incubation. The male bird, on being caught in a snare, permitted itself to be seized by the native without making any resistance. When brought to me, lying in the arms of the native, apparently conscious of its situation, and without making use of its claws or bill, or exerting any efforts to extricate itself, it suffered itself to be handled and examined very patiently. On being placed in a large cage, it made a few efforts in the beginning to set itself at liberty, but finding them ineffectual it soon desisted, and by its calmness and dignity of manners, exhibited a resemblance to the more noble species of Falcons. During the first days of its confinement, it refused food altogether, but on becoming hungry, a fish was quietly placed in its bill, which was finally swallowed with great caution; and it soon took greedily the fishes which were liberally supplied. Its usual attitude was with the bill half open, and appeared to have frequent thirst, and took up copious draughts of water. The pair of birds which I obtained on these hills had been carefully observed by the natives for several years. Their cry resembled that of the Osprey. They lived exclusively on fishes. They never attacked fowls or other animals. They daily resorted to the lake above mentioned, over which, suspended in the air or sailing slowly along, they watched their prey. On observing a fish, they darted on it with impetuous velocity; more rarely they pursued a more passive conduct, and watched the lake from the trees in its neighbourhood."- (Horsfield, Zool. Res. in Java.)

b. c. Drawing. Siam. From Finlayson's Collection.

"This bird is not very common," remarks Mr. Jerdon. "I first observed it sailing over the Chilka lake, at a considerable elevation, from whence it made an unsuccessful swoop at a duck I shot. I

again saw it sitting sluggishly on the sandy beach close to the sea; and again, near Calicut, saw a pair skimming very closely over some low bushy ground. The stomach of the specimen I procured was empty. The fishermen at Ponany assert that it lives chiefly on fish, and frequently carries one off from their boats or nets. It doubtless, however, varies its food according to opportunity. Its flight at first after rising is heavy, but when once fairly on the wing, easy and powerful, rising to a great height by large and graceful swoops."—(Madr. Journ. L. S. X. p. 65.)

Mr. Blyth remarks: "In the stomach were found three small water-snakes, some articulæ of Crustaceans, the humerus of a bird, and the remains of a small rodent."—(Journ A. S. B. XI. p. 110.)

"This is a bold and formidable-looking bird, but shy and solitary, frequenting desert islands in the Gulf of Siam, and generally seen soaring at a great height above the wooded hills. It would appear to live chiefly on fish. Its flight is slow, but bold and vigorous, yet not rapid."—(Finlayson's MS. Notes.)

"The manners, mode of life, &c. of this bird are similar to those of the Kite, being much on the wing, sailing over tanks, paddy-fields, and rivers, at a moderate height, and with a flight like that of the Kite, but perhaps with more frequent motion of its wings. Mr. Hodgson says 'it quests like Circus.' This I have only seen in wooded country (in Travancore), and then its flight was higher, and not nearly so regular. I may also remark that its squeal is very similar to that of the Kite. Mr. Hodgson also says 'it lives chiefly on insects.' From my own observations, made chiefly in the Carnatic, where it is very common, I should say it prefers aquatic food. It may frequently be observed to carry off a fish from the surface of the water; but I never saw it dip under. It also feeds much on crabs from tanks and paddy-fields, also on frogs and various aquatic in-

sects, and occasionally carries off a dead or wounded snipe or other bird, and even carrion, and, it is also credibly said, young birds, chickens, and pigeons; though I have not myself witnessed it. I have, though very rarely, seen it whip an insect off a tree or standing grain; this, and its food generally, if not heavy, it often devours in the air like the common Kite, or seated on the edge of a tank or river, or bank of a paddy-field. It partakes very greedily of the small fish so generally dried by the poor on the coast, and I have repeatedly seen it catch one thrown up in the air for that purpose by a native. From this we must conclude that it varies its food according to opportunity, but undoubtedly it prefers the neighbourhood of water, and aquatic food, as crabs, frogs, and fish, when procurable. It is, as is well known, sacred to Vishnu."—(Jerdon, Madr. Journ. L. S. X. p. 72.)

Colonel Sykes states: "It is seen constantly passing up and down rivers at a considerable height, but prepared to fall at an instant on its prey. Usually it seizes while on the wing, but occasionally dips entirely under water, appearing to rise again with difficulty. It is quite a mistake to suppose it feeds on carrion. I examined the contents of the stomach and craw of many specimens, and always found fish, and fish only, excepting on one occasion, when a crab was met with. Sexes alike. The female lays two large white eggs."—(P. Z. S. (1832), p. 78.)

Mr. Blyth also states: "A very common and conspicuous species, abundant along the rivers, and generally observed near water. Has a peculiar strange bleating cry."—(Ann. Nat. Hist. XII. p. 91.)

"It is very common in the Bay of Batavia, where it feeds on fishes."—(Horsfield.)

"Europeans have given this bird the appellation of Brahminy Kite, which originates in having observed that the Hindoos attach superstitious ideas to it. Among the Mahomedans there is a prevalent notion that when two armies are about to engage, the appearance of one of these birds over either party, prognosticates victory to that side. It is, perhaps, possible that there may be something like migration in the habits of this bird. I have noticed that at some periods of the year it is more common than at others; in the cold season it abounds, while in the rains it is rarely met with."—(Pearson, Journ. A. S. Beng. X. p. 629.)

The N. African Buzzard.

Gedakede, Abyssinia, Rüppell.

GOODIE GOODIE, Abyssinia, Salt.

A. B. Abyssinia. From Sir W. Harris's Collection.

Dr. Rüppell explains the specific name of this bird in the following remarks on its habits. "The principal nourishment of this Falcon consists of small birds and bats; the latter it pursues chiefly on their being roused from their retreats by conflagrations of dry grass plains, or by the noise occasioned by the march of large masses of men; and they have frequently been observed to soar aloft before (vorauscheveben) armies or caravans. This has, probably, been the cause that the Abyssinians ascribe to the Buteo augur a peculiar gift of prognostication (prognostications guba, the faculty of augury) which has already been recorded by Salt. But the assertion of that author, that the inhabitants will not allow one of these birds to be killed, is not confirmed by my personal observation."—(Rüppell, Faun. Abyssinica, p. 38.)

"The Abyssinians entertain a singular superstition respecting this bird. When they set out on a journey and meet with one of them, they watch it very carefully, and draw good or bad omens from its motions. If it sit still, with its breast towards them until they have passed, it is a peculiarly good sign, and everything is expected to go on well during the course of the journey. If its back be turned towards them, it is considered an unpropitious sign, but not sufficiently so as to create alarm; but if it should fly away hastily on their approach, some of the most superstitious among

them will immediately return back to their homes, and wait till a more favourable opportunity for commencing their expedition occur. From this circumstance, and the resemblance of its form to those so frequently met with among the hieroglyphics in Egypt, I am led to suspect that this species may answer to the sacred hawk of that country which was venerated by the ancient inhabitants."—(Salt's Travels in Abyssinia, App. p. 42.)

"One of the most common birds in Abyssinia. Never found anything but locusts in its stomach. Is very inactive and slow in its provements."—(Dr. Roth's MS. Report.)

- a. Lower Bengal. Presented by the Asiatic Society of Bengal.
- b. Babylon. Presented by Commander Jones.

"This is certainly a rare bird," remarks Mr. Jerdon. "I have hitherto only seen it near Jaulnah, perched on low trees or on the ground, in fields or near water, and taking a low and short flight to another similar perch. In the stomach of the specimen I shot there was a Gryllotalpa (cricket). Mr. Elliott, who met with this species only in Guzrat, says: "This bird evidently preys on the field-rats which abound in the sandy soil of this province. He is seen sitting on low trees or bushes over the rat-burrows, and, watching his opportunity, darts down on his victim. In the stomach of one were the exuvice of a rat (Arvicola) and a large beetle."—(Madr. Journ. L. S. X. p. 76.)

According to Mr. Hodgson, "These birds are very common in the central and northern hilly regions of Nepal, but I never," he remarks, " procured one from below. It adheres to the woods when the crops are up; but, after harvest, comes into the open country, and is perpetually seen perched on a clod, and looking out for snakes, which constitute its chief food. It also preys on rats and mice, and on quails, snipes, and partridges; but is reduced to take the birds on the ground. I have seen it, however, make a splendid stoop at a quail, which, after being flushed, chanced to alight on a bare spot, so as to be visible to the bird as he followed it with his eye on the wing and marked it settle. Teal and even ducks are frequently slain by our bird in the same way. If he can perceive them take wing, even at half a mile's distance, he is up with them in an instant, and is sure to capture them, unless they are under cover in a moment after they touch the earth."-(Hodgs., Beng. Sport. Mag. (1836), p. 181. Blyth, Journ. A. S. Beng. XII. p. 310.)

"I have only met with this bird in the jungles of the western coast and Neilgherries. It is by no means common. I occasionally saw it seated on a tree, alternately raising and depressing its peculiarly-formed crest, and on the Neilgherries frequently saw it questing diligently backwards and forwards over the dense woods there. I procured a female at the foot of the Conoor pass, and a male on the summit of the hills. Their usual flight is rather slow, but I once observed one flying much more rapidly than in general, with a continued motion of its wings, and every now and then attempting to hover, which it did with its wings turned very obliquely upwards. This seemed a great exertion to it, and was very clumsily performed. In the stomach of the female I shot, was a soft green mass, which looked like vegetable matter, but which was, probably, the half-digested remains of green caterpillars. In the stomach of the male there was a large quantity of pure honey. (Mr. Elliott found the hair of a rat in the stomach of one; in another, ants, wax, and honey.) The female contained an egg ready for expulsion, which was very different in colour from that of the English Honey-Buzzard figured in the 'Naturalist's Library,' and closely resembled that of the common European Kite."-(Jerd., Madr. J. L. S. X. p. 73.)

- e. Madras. From Wight's Collection.
- f. Afghanistan. From Griffith's Collection.
- g. Drawing. From Dr. F. (B.) Hamilton's Collection.

"Numerous in the Dukhun, and found in families of four or five. An exceedingly noisy bird, frequently heard chattering during the daytime in dense trees. Mice and beetles were found in the stomach. The Mahrattas have a superstition respecting this species; and a class of persons, called from it Peengleh, live on the credulity of the people by pretending to consult it and predict events."—(Colonel Sykes, Proc. Zool. Soc. (1832), p. 82.)

Mr. Jerdon also gives the following remarks of this bird: "This little Owl is extremely abundant in Southern India, and is often very annoying from its familiar and noisy habits. It generally roosts during the day in large trees, but frequently also in the eaves of houses or under the roof; and though it is most active and noisy during the night-time, feeding then, yet it is often very noisy during

the day, uttering its harsh squabble, three or four joining in chorus at the same time. Its usual ery is something like 'jukl-jukl,' repeated very quickly. About sunset it usually sallies forth from its roosting-place to feed. Its chief food is beetles and other insects, but it occasionally captures mice. It takes insects sometimes on the wing, or snaps one off the ground or the trunk of a tree during its low undulating flight, which is generally short, but at times prolonged to some distance over the plain. In some parts of the country it is supposed to have the power of divination."—(Madr. Journ. L. S. X. p. 91.)

### a. Kumaon. From Captain R. Strachey's Collection.

"This pretty little Owl is exceedingly common in the Himalayas in the neighbourhood of Mussoorie and Simla, and may be heard at nightfall uttering its monotonous but not unmusical whistle of two notes oft-times repeated. It nidificates in hollow trees without any preparation of a nest. On the 11th May, 1848, I found three young ones and an egg just ready to hatch, in a hole of a wild cherry-tree. The egg was nearly round and pure white, but being broken I could take no measurement of it. The young ones were clothed in a soft and pure white down. The old female remained in the hole while we cut into the tree, and allowed herself to be captured."—(Hutton, Journ. A. S. Beng. XVII. part 11. p. 5.)

Mr. Tickell remarks: "Very common in the thickly-wooded parts of the Jungle Mehals, selecting the largest trees for its abode, from whence it keeps up its clamorous cries the greater part of the day. It is active, frolicsome, and diurnal, and feeds on insects."—(Journ. A. S. Beng. 11. p. 572.)

"It frequents lofty trees, and flies about actively in the daytime, at least when disturbed. I have generally found it single; rarely in small flocks. It feeds on various large insects, chiefly coleopterous."—(Jerd., Madr. Journ. L. S. X. p. 91.)

- d. Drawing. From Dr. F. (B.) Hamilton's Collection.
- "Inhabits the retired parts of the thickest jungle, coming towards the edges and open parts at night. It is completely nocturnal, and in a calm moonlight night, its incessant cries are heard to a great distance, resembling strongly those of a strangling cat. Mr. Elliot says: 'when seized, it cries like a child.'"—(Tickell, Journ. A. S. Beng. II. p. 572.)
- "The natives consider this bird as very unfortunate, and when one of them cries near a house, the inhabitants go out with lights, to which it has a great aversion, and drive it away. The cry resembles greatly that of a hare when caught by the hounds. When irritated, it raises its feathers considerably."—(Dr. F. (B.) Hamilton, MS. I. p. 57.)

Mr. Hodgson says this bird "tenants the interior of umbragecus woods, and by reason of the feeble light penetrating them even at moonday, it is enabled to quest subdiurnally in such situations. It preys on pheasants, hares, rats, snakes, and sometimes on the fawns of the Ratwa (Cervulus moschatus) and Ghoral (Nemorhedus goral)."—(As. Res. XIX. p. 173.)

Mr. Jerdon also remarks: "I found this powerful and splendid Owl in the dense and lofty forests of Malabar. It is chiefly nocturnal, issuing forth to the more open spaces about dusk. I was informed by an intelligent native that it feeds on various mammalia, and also on fish, and that it will dive to some depth for these. The stomach of the only specimen I procured was empty. It had just perched on a large palmyra palm overlooking a tank. It utters a low moaning cry at intervals."—(Madr. Journ. L. S. X. p. 90.)

GHOOGHOO, Hind., Jerd.

GOOBUR, Mahrattas, Sykes.

- · HOKRA CHEEL, Doon, Hon. F. J. Shore.
  - A. B. Dukhun. Presented by Colonel Sykes.
  - c. Kumaon. From Captain R. Strachey's Collection.
  - d. N. India. Presented by the Reverend F. W. Hope.

""The Googoo is the most abundant and most universally-spread of the large Owls of India. In the Carnatic it frequents rocky barren hills chiefly, where several may often be seen seated even for some hours after sunrise. In the Deccan it frequents rocky ravines, banks of rivers, and holes in the steep sides of the precipitous trap hills; also often found about old buildings, forts, and walls. On the Neilgherries it is, however, found in the dense woody glens. Though partially diarnal, it chiefly preys during the night: its chief food is rats and lizards; occasionally birds, crabs, and frequently large locusts. I have had a pair of this species, male and female, in my possession. Their usual cry is a single loud, clear, and prolonged hoot. I occasionally at night heard them utter a low indistinct strangling sort of cry. They vomit bones and feathers in the form of a pellet. When alarmed, they hiss, and make a loud snapping noise with their bills. If a dog or other animal approaches, they lower the head almost to the ground, erecting the whole of the feathers of the body, and spreading out their wings to their full extent. These, from the stooping position of the bird, are nearly vertical, almost touching the ground with their upper edge, and from their extent this bird presents a formidable front to an intruder. Their egrets certainly seem connected with their exalted sense of hearing, being generally raised whilst in the act of listening. They are also erect during sleep, at which time the wings are also occasionally brought forward." -- (Jerdon, Madr. Journ. L. S. X. p. 87.)

"This bird, when disturbed, flies freely and strongly in the broad glare of day, and though it is not properly a diurnal quester, yet it commonces operations long before dark, and by carrying them on in the open country. Its habitation is sometimes in a hole or burrow in a bankside (in which they always breed), and sometimes their domicile consists merely of a perch upon the stunted trees growing from rocky declivities. It breeds in March, and the young, as soon as fledged, resemble their parents: the broad consists invariably of two of them."—(Hodgson, As. Res. XIX. p. 170.)

Colonel Sykes, also, remarks: "Very common in the Dukhun, and generally found on the open rocky plains. A whole rat (the tail hanging out of the mouth, and the head and most part of the body in the stomach and partly decomposed) was found in one bird; another had a crab; a third a bird (Pastor): but the usual food appeared to be rats."—(Proc. Zool. Soc. (1832), p. 81.)

The Honourable F. J. Shore gives the following notes: "Builds in trees, the nest being composed of large and small sticks, the female laying two large eggs mottled with black, reddish-brown, and white. Its native name in the Doon is Hokra Cheel, the natives considering it among the Cheel or Kite genus, and affirming that it is strong enough, and does, in fact, attack and kill wild cats."—(Gould, Cent. of Himal. Birds.)

The Yellow-footed Cultrunguis, Hodgs.

Nok-noak, Siam, Finlayson.

- a. Kumaon. From Captain R. Strachey's Collection.
- B. c. Himalaya. From W. Griffith's Collection.

"This species is common in the several regions of Nepal, notwithstanding the great diversity of climate. They fly well by day, and were constantly found on the banks of rivers. I have procured specimens with the stomach full of fish; and they also prey on crabs. Their weight is about three and a half pounds. These birds moult once a year, between June and October inclusive; they breed in February and March. The intestinal canal is from three and a half to four feet long; very thickly coated throughout; considerably wider above than below, and furnished with two thin caeca from three to four inches long, which are situated near the anal extremity of the canal, and widened considerably at their distad end. The stomach is rounded, considerably and equally thickened in its coats, and provided with a toughish and rugose lining, which is easily separated. The coats do not consist of proper muscle, but of a substance between gland and eartilage, for which I know no name, commonly as it occurs. The succentorial stomach is purely glandular, with soft papillated lining, not distinguishable from the body of the organ; the points of the papillæ being in fact mere excretory pores, directly in contact with the secreting substance."—(Hodgson, Journ. A. S. Beng. V. p. 365.)

"This is a heavy, clumsy bird, but very powerful. It is usually seen on the wing in the twilight. It is common in the Indian islands and at Siam.

"There is scarce any substance in the animal or vegetable kingdom which the Ultra-Gangetic nations do not apply to medical purposes, a practice which the Siamese would appear to have adopted from the Chinese, who have carried this singular fancy to the greatest length.

"The skull of this bird is held in considerable estimation as a medicine in small-pox, and chiefly to check and to alleviate the itching sensation which takes place in the curative stage. For this purpose, the head is rubbed upon a stone with water, which, thus impregnated, is received into a vessel, from which an attendant spurts a quantity of it on the body from time to time."—(Finlayson's MS. Notes.)

- f. Drawing. From Dr. F. (B.) Hamilton's Collection.

Mr. Hodgson applies the habits of the preceding species to this also, and Mr. Jerdon also says: "This powerful bird is generally spread throughout India, though far from being common; it frequents chiefly the more wooded districts, though also found in topes and avenues in open country. It is partly diurnal. Its voice is a loud and harsh hollow laugh."—(Madr. Journ. L. S. X. p. 90.)

Licutenant Tickell remarks on the habits of this bird: "Frequents the thickest jungle, in deep retired dells, between high rocks or scarped hills, perching low, and passing the mid-day in the centre of some impervious thicket. It is, however, partially diurnal, and easily flushed in the brightest day, when it flies heavily over the underwood to a short distance, and drops headlong into the first convenient bush. Towards twilight, it emerges from its concealment, and may be observed seated with great majesty on the summit of some granite boulder, on the side of a hill overlooking the surrounding jungle. Its voice is hoarse and hollow, and, connected with the gloomy scene and hour in which it is heard, the repulsive laugh in which it occasionally vents its notes, 'Haw, Haw, Haw, Ho!' cannot fail to strike a fanciful listener with unpleasing associations."—(Journ. A. S. Beng. II. p. 571.)

Wowo-wiwi or Kalong-wiwi, Java, Horsf.

A. B. c. Java. Dr. Horsfield's Collection.

<sup>\*</sup> Phodilus, Auct. corrigend.

"The Wowo-wiwi is rarely met with in Java. It never visits the villages, but resides in the closest forests, which are the usual resort of the tiger. The natives even assert that it approaches this animal with the same familiarity with which the Jallak (Pastor jalla, Horsf.) approaches the buffalo, and that it has no dread to alight on the tiger's back. The Wowo-wiwi is never seen in confinement; the few individuals which I obtained were from the closest forests of the district of Pugar, and from the ranges of low hills south of the capital of Surakarta. Like most other species of this family, it is a nocturnal bird."—(Horsfield, Zool. Res. in Java.)

"This well-known and common bird is spread in numbers over all India. It generally hunts, like the true fly-catcher, from a fixed station, which is either on the top or upper branch of a high tree, or on the branch of a shrub or hedge, a bare pole, stalk of grain or grass, or some old building. Here it sits looking eagerly around, and on spying an insect, which it can do a long way off, captures it on the wing with a distinct snap of its bill, and then returns to its perch, generally sailing slowly with outspread wings, the coppery burnishing of its head and wings shining conspicuously in the sun-Sometimes it hunts alone, at others in small parties, seated near each other. Frequently it captures one or two insects before it returns to its perch; and in the morning and evening considerable numbers are often seen, sometimes in company with swallows, hawking actively about. The bee-cater also often changes its perch, taking up a fresh one at some distance. It has a peculiar loud, yet rather pleasant whistling note, which it often repeats in the morning and evening when gathered together. In the bare tableland, the Hurrial generally retires to some seeluded and jungly district for the purpose of breeding, which it is said to do in holes in

ravines. It sometimes picks an insect off the ground, or off a flower or branch. I have often seen this bird collect towards sunset in small parties on a road, and roll themselves about in the sand and dust, evidently with great pleasure."—(Jerdon, Madr. Journ. X1. p. 227.)

Mr. C. W. Smith, in his MS. Notes, says: "Their time of incubation is the month of June, and for months after they are hatched the whole brood congregate, and swim about with the swiftest and most entire movements through the air, making short dips, and returning to the topmost twig, from which they took flight. During these evolutions, they are busily employed in snapping up the insects."

"The Green Bee-eater has the power of gliding along for some distance without closing its wings, so that its flight consists of two parts,—a rapid commencement in which the wings flap rapidly, and a quick glide with the wings and tail fully expanded. Its motion, especially in this latter position, is extremely elegant."—(Pearson, Journ. A. S. Beng. X. p. 631.)

Mr. Blyth also remarks: "This bird is extremely common, but disappears in the rainy season. It breeds in the neighbourhood of Calcutta, as I have had specimens brought me with eggs ready to lay in the month of March. The general habits of this bird are those of a fly-catcher, but it frequently hawks for insects on the wing, many together, like swallows."—(Ann. Nat. Hist. XII. p. 93.)

"This bird prefers a well-wooded country, and I have seen it in Goomsoor in open parts of the jungle, and in the west coast occasionally in similar situations. It is almost always found in small parties scated on the tops of high trees, frequently among wet paddyfields, and in general, perhaps, making a much longer circuit than the last one, capturing several insects before returning to its perch. I have on one or two occasions seen it perched on a low palisade overhanging some water, and every now and then picking an insect off the surface of the water. I once saw an immense flock of them at Caroor, in the Carnatic (Coimbatoor district), and in the beginning of March. There were many thousands of them perched on the lofty trees lining the road there, which sallied forth for half an hour or so, making a great circuit before returning. These birds were most probably what had been spread over great part of that country, now collected to migrate into a more wooded region during the approaching hot season, when insect life is scarce. Like the Hurrial, this has a loud and pleasing sort of whistle, but more full and mellow."—(Jerdon, Madr. Journ. L. S. XI. p. 228.)

- c. Afghanistan. From Griffith's Collection.

Mr. Hodgson, in his remarks on the habits of this bird, says "that they are of rare occurrence, and are solitary woodlanders. They are found in the lower and central regions of Nepal, but seldom or never in the northern. Their food consists of bees and their congeners, but they likewise consume great quantities of scarabæi and their like; they seek the deep recesses of the forests, and there, tranquilly seated on a high tree, watch the casual advent of their prey, and, having seized it, return directly to their station. They are of dull, staid manners, and never quit the deepest recesses of the forest. In the rajah's shooting excursions they are frequently taken alive by the clamorous multitude of sportsmen, some two or more of whom single out a bird, and presently make him captive, disconcerted as he is by the noise. The intestinal canal in this bird is usually about twelve inches long, with caca of an inch and more in length, placed near to the bottom of it. The stomach is muscular, and of medial subequal thickness. Such, too, is the character of the stomach and intestine in Merops."—(Journ. A. S. Beng. V. p. 361.)

Mr. Jerdon says: "I observed this species several times at the foot of the Coonoor pass of the Neilgherries, in dense and lofty jungle. One time it was alone, at others I observed it in pairs, perching on the tops of the highest trees, and flying before you from tree to tree. I was not fortunate enough to obtain a specimen, owing to their extreme wariness."—(Madr. Journ. L. S. XI. p. 229.)

Captain Boys also informs us, that "this beautiful bird has a

peculiarly wild note, and is very difficult of approach. I never obtained but one specimen, and that was procured at considerable risk, as the khud up which I followed it was a resort for wild animals of all kinds; indeed, while engaged in its pursuit, a leopard set up his hideous snarling from the opposite side of the khud."—(Gould, Birds of Asia.)

The Panayan Swallow, Lath.

The Javan Swallow, Lath.

- A. B. C. Dukhun. Presented by Colonel Sykes.
- D. E. f. Assam. Presented by J. McClelland, Esq.
- g. Khussuk. From Griffith's Collection.
- h. i. Drawings. From Heyne's Collection.
- j. Young. Nepal. Presented by B. H. Hodgson, Esq.

"This is perhaps the most generally distributed and abundant of the Indian swallows, being found in all parts of the country, frequenting both the neighbourhood of water, open plains, and gardens: it appears to differ but very slightly from the European swallow. I do not know that it breeds in this country, but think not; and it certainly disappears from some places during the hot season and monsoon. If it does not breed in the north of India, it probably spreads over the north of the Asiatic continent."—(Jerd. Madr. Journ. XI. p. 237.)

Captain Thomas Hutton remarks: "I first saw this bird on the wing at Candahar, on the 8th February, 1840, and 5th February, 1841. They are abundant throughout the summer months, and build in the open rooms, in temples, &c. They retire in October. advent and departure both depend upon the mildness of the seasons. so that they are sometimes later, sometimes earlier than above stated. I have seen them on the wing when the thermometer stood no higher On the 8th February, 1840, when I saw the first swallow of that year, there had been hard frost and ice during the night; but the morning was fine and sunshiny. On the 16th of that month, the thermometer stood at 38°, and on the 17th, again at 36°; yet swallows were twittering, and on the wing, coursing after insects, which are abundant at that season. This fact, however, would seem to argue that migration does not take place with these birds so much from a dread of encountering cold, as because their natural food begins to fail them in the autumnal season. But where do they migrate to, for we have them at Candahar precisely at the same seasons as in England? Do they travel to the Eastern Isles, or to the regions of Southern Africa, or where? I have seen another species at Mussoorie also on the wing, on the 20th February, 1842, when frost and ice were on the ground, though the morning was fine and sunshiny."-(Journ. A. S. Beng. XVI. p. 781.)

The Daurian Swallow, Lath.

Red-rumped Swallow, Jerd.

- A. Dukhun. Presented by Colonel Sykes.
- b. Calcutta. Presented by the Asiatic Society of Bengal.

"This swallow in general prefers the proximity of jungles. I obtained it in the jungles round the Neilgherries (and also on the summit of the hills), in various other parts of the west coast, and in the Carnatic, at the Tapoor pass. In the northern parts of the table-land, however, I have seen it occasionally in the cold weather only, both in the neighbourhood of water and on dry open plains. It is often seen in the jungles it frequents seated in great numbers on a tree."

Mr. Elliot says: It "flies after insects; and when its mouth is full, sits on a tree to devour them."—(Jerdon, Madr. Journ. XI. p. 237.)

Mr. Hodgson says: "This is the common swallow of the central region of Nepal, a household creature, remaining with us for soven or eight months of the year."—(Journ. A. S. Beng. V. p. 781.)

"This species appeared in millions in two successive years," says Colonel Sykes, "in the month of March, on the parade-ground at Poona: they rested a day or two only, and were never seen in the same numbers afterwards."—(P. Z. S. 1832, p. 83.)

ABABEEL, Saharunpore, Royle.

- A. B. C. Dukhun. Presented by Colonel Sykes.
- d. Bengal. Presented by Dr. Falconer.
- e. Kumaon. From Captain R. Strachey's Collection.

"This, by far the most elegant of the swallows, is only found towards the more southern portion of the peninsula, about water. In the more northern parts, however, it is more abundant, and generally spread, frequenting not only the neighbourhood of water, but also fields, gardens, and open plains. It is found in small parties of four, six, or more. It breeds in holes of old walls and buildings, generally in the neighbourhood of water, also in wells and bowries, forming a small mud nest, much open at the top. Its long thread-like tail-feathers are only observable at a few yards' distance, and in consequence of this, nine-tenths of the Europeans here are unaware of its existence. It occasionally perches on trees."—(Jerd. Madr. Journ. L. S. XI. p. 237.)

Colonel Sykes observes: "Very abundant in the Dukhun, and very beautiful, with its thread-like tail-feathers floating behind when in flight."—(P. Z. S. 1832, p. 83.)

#### Subfam II. CYPSELINÆ, Bonap.

Genus Collocalia, G. R. Gray, List of Genera of Birds, p. 11 (1840), and Genera of Birds, I. p. 55.\*

HIRUNDO, Linn. et al.

#### 122. COLLOCALIA NIDIFICA, G. R. Gray.†

Hirundo fuciphaga, Thunberg, Act. Holm. (1772), XXXIII. p. 151, t. 4. Shaw, Zool. X. p. 111, t. 12.‡

<sup>\*</sup> Mr. Blyth makes favourable mention of the ground on which the genus Collocalia was established by Mr. Gray. See Journ. A. S. Beng. XIV. p. 209.

<sup>†</sup> In the present case the specific name of Mr. Gray has been adopted (contrary to the rule generally adhered to in this Catalogue) in preference to that of Thunberg, which was founded on an erroneous opinion of the substance with which the nest is constructed.

<sup>‡</sup> To Professor Thunberg belongs the credit of having given that specific rank and character to the bird which in the Indian Archipelago constructs the edible nests, the *Hirundo fuciphaga*, Thunb., or *Collocalia nidifica*, of Gray; by which it is clearly distinguished from the *Hirundo esculenta* of Linneus. The following extract from the "Transactions of the Stockholm Academy" explains his determination.

<sup>&</sup>quot;In my 'Travels,' vol. III. p. 319, and vol. IV. p. 164, I briefly mentioned the swallow which builds this jelly-like nest in the Tjirraton mountain, in peculiar caves, on the island of Java, which I took for Linnaus's II. esculenta, but which I afterwards found, on closer examination, to be an unknown species quite different from the esculenta; and since I have not found the same named or described by any Ornithologist, I have thought it worthy of being determined by characters, and described and still more figured, and thereby become fully known to Ornithologists. This species, called fuciphaga, builds its nests like esculenta, in fissures and clefts of rocks; and they form an excellent (both precious and remunerative) merchandise. Both birds are, at first sight, very like each other, so as to be easily confounded.

<sup>&</sup>quot;Hirundo esculenta of Linn. (Syst. Nat. I. p. 191) is that which Brisson has figured (vol. II. t. 46, f. 2, a.); but that which Rumphius has had drawn in the Herb. Amb. vol. VI. t. 75, f. 3, 4, is my fuciphaga. It seems that Rumphius had seen and confounded the two species; that the elder Rumphius in his description meant H. esculenta, and his son, who drew the figure, had H. fuciphaga for his pattern. The following is the description:—

<sup>&</sup>quot; H. fuciphaga: supra atra, subtus cinerea, tota immaculata.

<sup>&</sup>quot;' Hab. in Java, in montium rimis prægrandibus, fere inaccessilibus, ad Tjirvaton; et alibi in insulis Moluccanis. Corpus supra atrum, immaculatum, via nitens;

- Collocalia nidifica, G. R. Gray, Gen. of Birds, I. p. 55; Cat. B. Brit. Mus. II. p. 20. Blyth, Cat. B. Mus. A. S. Beng. p. 86. Bonap., C. G. Av. p. 343.

The other synonyms cited by Linnæus have no authority but that of Bontius. At the period of the publication of the tenth edition of the "Systema Nature," the only authority for the specific character of Linnæus, was that of Rumphius above cited:—seque caudæ plumæ separantur alba conspicitus macula.

Brisson's Ornithology, which was published in 1760, gives the character of the Hirundo riparia cochinchinensis:—Hirundo superne nigricans, inferne albida, rectricibus nigricantibus, apice albis. This rests entirely on the drawing and description of M. Poivre.

At the present period no authentic specimens of the *Hirundo esculenta*, as described by Linnæus, as far as has been ascertained, appear to exist in modern museums. It requires, therefore, further observations to determine whether the *H. esculenta* described by Linnæus be really a distinct species, or a variety vaguely and incorrectly indicated, while the faithfulness of M. Poivre's drawing is questioned by modern Ornithologists.

Bontius gives no description of the bird.

Linchi Swallow.

LINCHI, Java, Horsf.

A. adult, B. young and nest. Java. From Dr. Horsfield's Collection.

The earliest notice in works on natural history of a species of Hirundo producing the so-called edible birds'-nests, is given by Bontius in the "Historia Naturalis Indiæ Orientalis," published in the year 1658, chapter XIII., de Nidis Hirundinum edulibus.

About half a century later, the same subject attracted the attention of the two distinguished Dutch writers, Valentyn and Rumphius. The former describes the bird as he observed it in the Moluccas, Amboyna, Ternate, and Gilolo. See "Oud en Nieuw Oost-Indien," door Francois Valentyn, III. Deil, p. 328 (1726).

Rumphius, whose "Herbarium Amboinense" was completed before the end of the seventeenth century, though not published till 1750 by J. Burman, gives a very detailed description of the bird producing the nidi esculenti or sarong-burong, with copious remarks on its habits, use, and distribution through the Indian Archipelago. His description, if correct, would confirm the character given by Brisson in the second volume of his Ornithology, on the authority of M. Poivre. "Ipsarum color," Rumphius states, "plerumque niger est cum cæruleo fulgore, sique caudæ plumæ separentur, in quavis penna alba conspicitur macula."—(Herb. Amb. vol. VI. p. 183.)

Soon after the commencement of the eighteenth century, these now celebrated edible nests became a subject of interest to naturalists and scientific travellers in the East. In a Catalogue of Birds found in the island of Luzon, entitled "Observationes de Avibus Philippensibus," the Esculent Swallow is briefly indicated in No. 36, as "Hirundo maritima: Salanga; aliis Sayan, Botabota vel Salangan; cujus nidus est tragacanthum venereum indicum. Nidus avium Schræderi: Patong Indorum, Enno Sinarum. Abundat in insula Jolo, Samboangan."— (Transactions of the Philosophical Society, vol. XXIII. p. 1396 (1702).)

The next author who notices them is the indefatigable Kæmpfer. In his "Amœnitates Exoticæ," published in 1712, he briefly indicates their use as an article of diet, and gives the Japanese name and character.

In the year 1718, Captain Daniel Beeckman found these nests as an article of commerce at Banjar-massing, in Borneo. "Besides pepper," he states, "they have plenty of birds'-nest, which is sold

at ninety or one hundred dollars per pikul. The whitest and clearest is the best."—(Voy. to Borneo, p. 146, Lond. (1718).),

In the year 1741, M. Poivre, late intendant of the islands Isle de France and Bourbon, while sailing up the Straits of Sunda on a voyage to China, discovered in a small rocky island, which rises as a solitary peak with precipitous sides from the ocean (known to mariners by the name of the Cap), an extensive cavern, the entrance to which was, at the time of his visit, darkened by a swarm of swallows passing out in a rapid stream, frantic and bewildered. On entering it, he found the sides lined with nests, many of which he collected, as well as specimens of the birds, which furnished the materials of an animated and detailed description, and of drawings which he communicated to M. Buffon, and which is given entire in vol. VII. p. 334, of the "Natural History of Birds."

The drawing represents the bird with white spots on the tail-feathers, as indicated in the specific character of Linnæus and in Brisson's Ornithology, but the accuracy of which is questioned by modern Ornithologists.

The article La Salangane, in Buffon's "Hist. Nat. des Ois.," above cited, contains a most elaborate and learned report on the subject of edible birds'-nests, from the most ancient times to the period of the publication of the volume, compiled with much critical detail from all the accessible sources of information.

About the year 1750, Osbeck, a pupil of Linnæus, visited East India as a Chaplain in the Swedish service: in the Faunula Sinensis, which J. R. Forster added to the translation of his Travels, in 1771, the bird is enumerated with Linnæus's name of H. esculenta. In 1783, Mr. Marsden published the first edition of his "History of Sumatra," which contains many novel and interesting remarks on the birds'-nests, as they are found in Sumatra, with observations on their history and value in commerce.

Thunberg, whose Travels were published about the year 1790, is the next author who refers to this subject: in the fourth volume, at page 163, he describes a visit to the caverns at Mount Tjirraton, in Java, in which the esculent swallows build their nests. At this time he had not noticed the character by which the Javanese species—the H. fuciphaga, Thunb.—was distinguished from the H. esculenta of Linnaus. See above.

A very full and authentic account of this bird is given by the Rev. J. Hooyman, in the third volume of the Batavia Society's Transactions, published in 1781. Besides an accurate description of

the bird itself, its form and colour, it details the author's personal observation on its habits, locality, and value in commerce, with many new and interesting particulars. Mr. Hooyman is the first writer who has correct notions on the substance from which the nests are prepared; and he contradicts and refutes the erroneous opinion entertained by preceding writers, as to the production of the nests from glutinous matters collected from Mollusca or from Fuci found near the seashore. He distinctly and correctly states the food to consist of insects; which is confirmed by later observations. The birds, he states, resort during the day to marshes, or hover over the inland lakes and plains, which abound with insects of all kinds; and he endeavours to prove that it would be impossible for birds living in the interior, to reach the coast and return to their caves in the course of one day. He is also the first author who entertains, at least partially, a correct opinion respecting the materials of which the nest is produced; describing it as being elaborated from the food of the bird, by a peculiar organic effort resembling secretion. This process has since been carefully examined and illustrated by Sir Everard Home, in a paper read before the Royal Society. After detailing the peculiar structure of the gastric glands observed in the esculent swallow, Sir Everard gives it as his opinion, that the mucous substance of which the nest is composed is secreted from the membranous tubes which surround the ducts of the glands previously described.\*

In the account of the voyage of the embassy of Earl Macartney to China, the vessels, in sailing up the Straits of Sunda, noticed in the precipitous peak, the Carabove mentioned by M. Poivre, two caverns containing edible birds'-hests, which led the author of the account (Sir George Staunton) to some interesting remarks on the subject, in which he gives the substance of the paper of the Rev. J. Hooyman, above referred to.

Professor Oken, in his general Natural History, has condensed in one view the observations given by various writers on the esculent swallow; which may be consulted with advantage: and the familiar History of Birds, by the late Dr. Edward Stanley, Bishop of Norwich, contains a pleasing and interesting epitome of what has been hitherto recorded on the subject.

<sup>\*</sup> Mr. Blyth confirms the researches of Sir Everard Home, by stating, in reference to this subject, that there can be no doubt that the glutinous matter found in the nests of various species of swallows is secreted by large salivary glands; and Mr. Laidley arrived at the same conclusion as to their constitution, by chemical analysis. See Journ. A. S. B. XIV. p. 210.

During the British possession of Java, from 1811 to 1816, the history and management of the birds'-nests engaged the attention of Government, chiefly on account of their importance as a source of revenue; and much valuable information was collected and made public. The substance of this the inquirer will find in the "History of Java," by the Honourable Sir T. S. Raffles, and the "History of the Indian Archipelago," by John Crawfurd, Esq.

The fact that these swallows congregate in large flocks in rock-caverns, and build their nests on the walls, is mentioned by all writers on the subject; and on the condition of these caverns much of the quality and value of the nest depends. Of the character and number of these caverns, as found in the Indian Archipelago generally, little is known; and it is only in Java that accurate information has been obtained.

The geological constitution of this island is peculiarly favourable to the attraction and shelter of these birds. In the interior, extensive ranges of limestone rock are abundant, containing caverns and fissures of considerable extent. The southern coast, near the ocean, consists in many localities of precipitous piles and strata of limestone, marl, and clay, intermixed with volcanic materials. In these, extensive caverns and fissures are naturally formed, which constitute The chief of these localities the favourite resort of these birds. along the southern shore are Karong-bolong, Rangkop, and Pajittan. Various details respecting the caverns found in these districts, their individual character and extent, the regulations established to secure a regular supply of nests, with other particulars which cannot be introduced here, are given in the eighth volume of the "Transactions of the Batavian Society of Arts," in an "Essay on the Geography and Geology of the Western Provinces of the Native Princes of Java," by T. Horsfield; and in "Travels through Java," by Dr. Fr. Junghuhn, pp. 108, 109.

The present administration and management of these caverns is founded on the experience of many years, and has been reduced to a remarkable degree of accuracy, so that the average quantity of nests to be expected from the individual caves can be estimated before the period of collection with considerable precision. This collection of the nests is undertaken, with occasional slight variations, at three annual periods, according to the subdivision of the year in the Javanese calendar. The largest gathering is made in the month Kapat, agreeing with October, after an interval of six months from the preceding period, Kasongo, corresponding to our month March:

from Kapat to Kepito (from October to December), and from Kepito to Kesongo (from December to March), the shorter periods of three months each are adhered to. These shorter periods barely allow the birds to complete their nests and the first period of incubation: many of the young birds are necessarily destroyed; but the nests themselves are generally of superior quality, and perfectly white. During the longer interval of six months, a second progeny is allowed to reach maturity: both broods complete their respective nests, and no birds are destroyed. The collection, of course, is proportionally large. According to the uniform report of the natives, the male bird frequently forms a separate nest. The mechanical contrivances of scaffolding and ladders to reach the nests, the risks in collecting them, their disposition in the caverns, and many other particulars, are detailed in the works above referred to.

Both Raffles and Crawfurd estimate the quantity of birds'-nests passing annually through the Batavian market to China, at about 200 pikuls. Of this quantity, about 100 pikuls are the produce of the caverns on the south coast of the island, which, according to Raffles, yield an annual revenue to the proprietors, the native princes and the government jointly (in certain proportions), of 200,000 Spanish dollars. About 50 pikuls are from caves belonging to individuals, while about 50 pikuls are brought to Batavia from other parts of the Archipelago. Besides these, the Suluh Archipelago alone produces 530 pikuls, and Macassar about 30. The entire quantity of nests annually sent to China is worth 1,263,510 Spanish dollars, or £284,290.

"The common prices for birds'-nests at Canton are, for the first sort, 3,500 Spanish dollars the pikul, or £5. 10s.  $3\frac{1}{2}d$ . per pound; for the second, 2,800 Spanish dollars per pikul; and for the third, no more than 1,600 Spanish dollars."—(Crawfurd, Hist. Ind. Archip. III. p. 433.)

In some parts of China, 40 Spanish dollars have been paid for one kati—rather more than one pound and a quarter English. Specimens were produced at the Great Industrial Exhibition of 1851, valued, the first quality, at £3. 2s. 8d. per pound; the second quality, at 9s. 44d. per pound; and the third, 3s. 1d. per pound.

It may be noticed in this place, that no extensive caverns have hitherto been indicated by Ornithologists as existing in the interior of Continental India, resembling those common in the Archipelago, which would constitute a favourable resort to these birds in large flocks, for the construction of nests in society, although the continental representatives of the Collocalia nidifica are found as well in the Peninsula as in the Upper Provinces. In describing the II. unicolor, Mr. Jerdon merely remarks: "I have found this remarkable species on the Coonoor pass of the Neilgherries, and about the edges of hills. It flies in large flocks, and with great speed."—(Madr. Journ. L. S. XI. p. 238.) And Mr. Blyth states: "The Society has received it (C. unicolor) from Darjeeling." Is it, therefore, exclusively a mountain species, which constructs glutinous nests like the other (C. esculenta), but in mountain caverns?

On the sea-coast of the Peninsula, however, several localities are indicated as producing edible nests. "On the Western Coast, for instance, in the group of small islands about eight miles west of Vingorla (which is 275 miles from Bombay), commonly known as the Vingorla Rocks, where about a hundred-weight of these nests are produced annually."—(Blyth, Journ. A. S. Beng. XIV. p. 209.) And Willughby mentions the Coast of Coromandel as likewise producing these nests, on the authority of Joan de Laet, in "Epistola ad Wormium" (Mus. Lib. 3, cap. 21).

According to Rumphius, the Collocalia nidifica is not only found along the coasts of the islands of the Archipelago, but also of Siam, Camboja, and Coehin China; and Mr. Blyth enumerates the following localities: Neilgherries, Ceylon, Sikim, Assam, and Malay countries.

In the Nicobar Islands, in the Bay of Bengal, the Collocalia Linchi, Horsf. (the C. fuciphaga, apud Blyth), represents the C. nidifica of Gray, as a constructor of edible nests. In the notice of these islands, the Reverend P. Barbe communicates some interesting particulars respecting the habits of these birds, which agree generally with the preceding details. "The nests are of different qualities; those of the first are worth from forty to fifty dollars the kati at Penang. The rest are sold at gradually decreasing prices, according to their purity."—(Journ. A. S. Beng. XV. p. 363.)

c. Kumaon. From Captain R. Strachey's Collection.

"The Ababeel, though of general distribution throughout the Peninsula, yet at the same time is so partially distributed as to have caused Colonel Sykes to remark: 'So rare in the Deccan, that I have only obtained two specimens.' It is found in all districts of India; but in these is often confined to a small tract in the neighbourhood of some few large pagodas, large old choultries, and other similar buildings. In the Carnatic it is common at Madras, at the rocky fort of Trichinopoly, and very numerous at the large pagodas of Madura, among which their nests are thickly crowded. On the west coast I saw it on several occasions, chiefly among rocky hills, but only observed it twice through the whole length of the table-land from the Tapoor pass to Jaulnah; and then but few in number. At this latter place, however, it was very common, breeding in some old choultries and other buildings. It seldom, I think, takes a very long range from its breeding-places. It builds its nest in company always, often thickly crowded together, placing them in corners and crevices of old buildings, and forming them of clay, profusely mixed with straw, grass, feathers, and other soft substances, of which they appear externally to be entirely composed. During the night they roost in their nests, four or five often occupying the same one, as I observed in the celebrated choultry at Ajunteh."-(Jerd., Madr. Journ. L. S. XI. p. 235.)

Mr. Hodgson says, "This is the common Swift of the central regions of Nepal, where it remains all the year, building under

thatched roofs and against the beams of flat roofs. It lays two white eggs, and breeds repeatedly."—(Journ. A. S. Beng. V. p. 780.)

Mr. Blyth remarks: "The nest of this species is generally so placed as to be concealed, or, at least, rendered inconspicuous by a rafter or other object in front; and its capacity would indicate that it is intended as much for a habitation for a number of the birds as for the ordinary purposes of incubation; but it would appear that there is no convenience in them for more than one pair of birds to incubate."—(Cat. B. Mus. A. S. Beng. Suppl. p. 10.)

Captain Tickell describes the nest of this bird as being "large, flat, irregular, of fine straw, hay, and feathers, closely interwoven, and kept together with a glutinous substance supplied from the bird's salivary glands, generally glued against some beam in a veranda or outhouse, in some remote corner. Eggs three, shape lengthened, spotless, white. Male,  $\frac{20}{3}$  ×  $\frac{9}{16}$ ; female,  $\frac{27}{3}$  ×  $\frac{9}{16}$ . July."—(Journ. A. S. Beng. XVII. p. 303.)

<sup>\*</sup> Balassiensis, Auct. corrigend.

- A. Assam. Presented by J. McClelland, Esq.
  - b. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This bird inhabits Bengal at all seasons, and is a nocturnal bird, appearing at sunset, and going to rest at sunrise. It builds its nest in the fronds of the Tal (Borassus flabelliformis, Linn.). The Bengalee name signifies a bird resembling wind, and is bestowed on this species on account of its swift flight."—(Dr. F. (B.) Hamilton, MS. I. p. 82.)

Captain Tickell remarks: "The eggs are  $\frac{3}{4} \times \frac{10}{32}$  (immensely large for such a bird), rather blunt, white, with rather large spots of deep claret-brown, most numerous at the big end. July."—(Journ. A. S. Beng. XVII. p. 302.)

Mr. Jerdon also remarks: "This species is common in all the districts of India, except on the bare table-land, where it is rare. As its name implies, it frequents groves of palms, especially the Palmyra (Borassus flabelliformis), and does not in general fly to any distance from them."—(Madr. Journ. L. S. XI. p. 236.)

Mr. Blyth also states: This bird "mainly affects rural districts, building its nests within the fronds of the fan-leaved palms, sometimes twenty or thirty pairs of them associating in those of a single tree; while it is also rare to meet with one of the same palms clustered with the pensile nests of the Baya (*Ploceus philippensis*), that does not also harbour two or three pairs of this elegant little Palm Swift."—(Journ. A. S. Beng. X1. p. 889.)

- e. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This fine Nightjar has been found dispersed, though sparingly, over all India, and has even a still more geographical distribution. 1 procured specimens from the Neilgherries and the Deccan, the West Coast, and even the Carnatic; but it is by no means a common species. It affects chiefly the more wooded portions of the country, being usually found, and more common, in forests than in the open country, and here frequenting only shady gardens and large groves. On the Neilgherries, it remains during the day in the dense woods, issuing from them about sunset, and then coming into the open ground, and perching on stones and trees, and from thence pursuing its prey. It is now and then flushed from the woods when beating for woodcocks and other game, and more than one have fallen beneath the gun of the inexperienced sportsman, its extent of wing and lazy flapping having caused it to be mistaken for the woodcock. flight is at times very rapid and noiseless, performed with but few vibrations of its wings. When roused in the daytime, it flies (like others of the genus) but a short distance, and then suddenly alights, and squats close to the ground, never that I know perching in the daytime. When hunting, it often alights on a branch, usually sitting in the direction of the branch, and not across it, its feet being not adapted for grasping firmly. The note of this Nightjar, though

somewhat like the sound of a stone scudding over the ice, has not such a close resemblance to it as the common species (*C. asiaticus*); it sounds something like Tew-yo-yo, frequently repeated. Its chief food is moths and beetles."—(Jerd., Ill. Orn.)

Serilophus lunulatus, Swains., Class. B. II. p. 262. The Frilled Tody.

a. Tenasserim. Presented by Dr. Helfer.

"Several examples of this bird were shot in the neighbourhood of Rangoon by Major Godfrey, who informs us 'that it inhabits the thickest jungles, and its food was found, upon minute investigation, to consist entirely of berries and fruits."—(Gould, Trans. Zool. Soc. I. p. 177.)

Dr. Helfer informs us, in his "MS. Notes," "that he observed these birds in societies of thirty to forty, upon the loftiest trees of the forests in the Tenasserim provinces, and that they are so very fearless that the whole flock can be shot down one after the other." They are of rare occurrence, he having observed them only once."

- C. D. Tenasserim. Presented by the Asiatic Society of Bengal.
- e. Drawing. Sumatra. From Sir T. S. Raffles's Collection.

"This species," says Sir Stamford Raffles, "is found in the interior of Sumatra, frequenting the banks of rivers and lakes, and feeding on insects and worms. It builds its nest pendent from the branch of a tree or bush which overhangs the water, and is said to lay only two eggs."—(Trans. Linn. Soc. XIII. p. 297.)

Mr. Blyth also remarks: "This bird is common in Tenasserim, in watery situations, and suspends its nearly globular nest, which is constructed of small twigs, from the branches of trees growing directly out of the water. The eggs are four in number, and pale spotless blue. The beak and eyes are very beautiful blue, the former fading within a day or two after death."—(Journ. A. S. Beng. X. p. 924.)

"The Gurial is not very common, but is more frequently met with in Bengal than in any other province. It is a strong and powerful bird; as an instance of which I once observed a contest between one of them and a Hawk of considerable size, in which the Hawk was worsted, and obliged to leave his hold from the effects of a severe blow which the other administered to him on the breast. When wounded, considerable caution is required in handling, for a single blow would disable a person's hand."—(C. W. Smith's MS. Notes.)

"The Gurial Kingfisher has a laughing screaming note. Its flight consists of short, quick jerks, very vigorous, and long continued. In fishing, it does not hover, but perches upon the high bamboo-bush, or on a middle-sized tree over a pool, waiting for its prey, where its blood-red bill shines brightly in the sun, and its great size, and violent plunge into the water, gives one the idea of a noble bird."—(Pearson, Journ. A. S. Beng. X. p. 633.)

"This bird is found throughout the year in the neighbourhood of Calcutta, and builds its nest in mud walls."—(Dr. F. (B.) Hamilton, MS. I. p. 65.)

- d. Drawing. Assam. Presented by J. McClelland, Esq.

"This is the most common and generally spread of the Indian Kingfishers, frequenting not only the banks of rivers and brooks, tanks, wells, and wet paddy-fields, but also dry cultivated ground, groves, old walls, and many other similar situations. It preys upon small fish (which it pursues below the surface), frogs, tadpoles, and various water-insects; also on small lizards, grasshoppers, and various other large insects. It has a very loud, harsh, rattling scream, generally uttered during flight. Is said to breed in holes on the banks of rivers."—(Jerd., Madr. Journ. L. S. XI. p. 230.)

Dr. F. (B.) Hamilton, in his MS., says "it builds its nest in trees."

The Biru Kingfisher.

MENINTING-WATU OF BURUNG-BIRU, Java, Horsf.

A. B. Java. Dr. Horsfield's Collection.

"This bird is by no means uncommon in Java. I observed it chiefly in the interior, in low situations; but it is also found in the maritime districts. Its habits and manners are those of the European Kingfisher. It darts in short rapid flights along the surface, among rivulets and lakes, emitting as it moves shrill sounds in a high key. These sounds are so strong and acute, that, when the bird is near, they strike the ear in an unpleasant manner. It is not unfre-

quently seen perched on trees on the banks of rivulets. Its food consists of small fishes, and of aquatic insects."—(Horsf., Zool. Res. in Java.)

- e. f. Mesopotamia. Presented by Commander Jones.
- g. Drawing. From Heyne's Collection.

"This species is very numerous throughout the continent, frequenting brooks, rivers, pools, and tanks. Unlike the other Kingfishers (which watch for their prey from a fixed station, and then dart down obliquely on it), it searches for its prey on the wing, hovering over a piece of water, and then darting down perpendicularly on it beneath the surface."—(Jerd., Madr. Journ. XI. p. 232.)

Dr. Pearson remarks, that, "from a height of twenty to thirty

feet, it plunges down dead as a stone into the water, and remains below it so long, that the ripple over the surface clears away sometimes before it comes up again."—(Journ. A. S. Beng. X. p. 635.)

"It is found in Bengal throughout the year, and builds its nest in holes in steep banks."—(Dr. F. (B.) Hamilton, MS. I. p. 140.)

"This elegant Flycatcher is dispersed over the whole continent of India, but is only at all common in the most woody portions of the country, preferring dense bamboo jungle to gardens and groves of trees, which it also occasionally visits. In its habits it is restless and wandering, flitting continually from branch to branch, and often wandering from tree to tree. It feeds on various insects, which it captures in the air, or occasionally snaps off a branch." Colonel Sykes says "it feeds on the ground, and chiefly on very small insects." "It is generally seen singly, occasionally in pairs. It is said to breed in bamboos. It has a loud, harsh, grating cry of alarm. When it seizes an insect, it makes a loud snap with its mandibles."—(Jerd., Ill. Orn.)

- e.f. Nepal. Presented by B. H. Hodgson, Esq., July, 1853.

"This pretty and lively bird is more numerously and extensively spread than any of its congeners, and is to be found in most woody situations, even in the dry Carnatic, in jungle, and in thick hedges and avenues occasionally, and in some of the larger topes in the Decean. It is, however, most abundant on the West Coast. It is a restless and active little creature, ever engaged in diligently examining the extreme branches of trees, gleaning among the foliage, and hanging from the slender twigs like a titmouse. It feeds upon various larvæ (which are its favourite food) and small insects."—(Jerd., Madr. Journ. L. S. X. p. 244.)

Lieutenant Tickell remarks: "The males unite in flocks apart from the females at the close of the cold season."—(Journ. A. S. Beng. 11. p. 574.)

A. B. & Q. Dukhun. Presented by Colonel Sykes. c. Locality uncertain.

- d. Drawing J (P. elegans, McClell.) Assam. Presented by J. McClelland, Esq.
- f. Kumaon. From Captain R. Strachey's Collection.

"This species is tolerably abundant in most of the lofty jungles of Southern India. I have also seen it in Travancore, Malabar, the Whynaad, and the forest skirting the base of the Neilgherries, and even as high as five thousand feet on the Coonoor pass. It ascends the sides of mountain ranges, and I fancied was more numerous in the elevated region of Wynaad than in most other localities. It is a tolerably common and abundant species in its appropriate haunts, and from its bright and showy colours attracts the notice of most travellers through the lofty forests of Western India. It keeps chiefly to the tops of high trees, where it may be seen, singly or in flocks of three or four, and the sexes are generally seen apart from each other, all frisking about, picking an insect or larva off a branch or leaf, or occasionally catching one in the air; the males keep up a continual whistling call."—(Jerd. Madr. Journ. L. S. X. p. 244, et Ill. Ind. Orn.)

Colonel Sykes informs us "the cry of this bird is wheet, wheet, wheet."—(P. Z. S. 1832, p. 85.)

"This pretty and lively fly-catcher is to be met with in well-wooded districts, as open forest jungle, gardens, and avenues of large trees. In the bare Carnatic it is only met with now and then in large topes or groves of trees and extensive gardens, and still more sparingly in some of the patches of low jungle found in the more hilly portions of the south of the Peninsula. Towards the more northern parts, however, it is much more common and diffused, and may be seen in every clump of trees or garden. In its habits it appears to be the most active and restless of the whole family, continually flitting about from branch to branch, snapping up an insect on the wing every now and then, and raising its outspread tail and lowering its wings, whenever it reseats itself on a twig. It hardly ever flies beyond a few feet after an insect, and seldom returns to the same perch, traversing in succession most of the branches of the tree, and not resting during even the heat of the day. I have usually seen it solitary, occasionally two or three in company. I have several times seen it alight on the ground, and on one or two occasions observed it seated on the back of a cow, and pursuing insects from this unusual perch. Its chief food consists of mosquitoes and other small dipterous insects; whence its Hindustani name."

"It has a pleasing little song, which it warbles forth every now and then, consisting of several notes following each other in a regularly descending scale."—(Jerd., Ill. Ind. Orn.)

"The only locality in the more southern part of India, where I have met this curious little bird, is the summit of the Neilgherries, in the dense woods of which it is not very uncommon. In the northern part of the Deccan, however, it is occasionally to be met with, only in the cold season however, in large topes of trees; and it increases in number towards the north, and in the jungly valleys and nullahs of the northern ghauts, it is by no means rare, always frequenting by preference the deepest thickets. Though not so lively as some fly-catchers, it is yet more so than many others. It frequently sallies forth from its perch on a twig after passing insects, and does not always return to the same branch, and often changes its perch, though it remains for some time in the same locality. It has a pleasant but feeble chirping note."—(Jerd., Madr. Journ. L. S. XI. p. 13.)

Captain Hutton remarks, "I took a nest of this species on 18th April, 1848, in a deep and thickly-wooded glen, at an elevation of 4,500 feet. It was placed against the moss-covered trunk of a large tree, growing by the side of a mountain stream, and was neatly and beautifully constructed of green moss, fixed in the shape of a watch-pocket at the head of a bed, to the mosses of the tree (with which it was completely blended), by numerous threads of spiders' webs. The lining was of the finest grass stalks, no thicker than horse-hair, and

beneath the body of the nest depended a long bunch of mosses, fastened to the tree with spiders' webs, and serving as a support or cushion, on which the nest rested securely. Within this beautifully constructed fabric were four small eggs of a dull white colour, with a faint olive tinge, and minutely spotted with pale greenish brown, and having a broad and well-defined ring of the same, near the larger end. The eggs were set hard. Diameter  $\frac{9}{10} \times \frac{8}{10}$  ins. Shape, bluntly ovate."—(Journ. A. S. Beng. XVII. pt. II. p. 689.)

i. j. k. Nepal (Bh. albirictus, Hodgs.). Presented by B. H. Hodgson, Esq., July, 1853.

"This is the most common and abundant species of Dicrurus, and is to be met with in every part of the country, and inhabits alike the open country and wooded districts, but is never found in deuse jungle. It may be seen perched on a tree or hedge, the top of a low bush on the plain, or a stack of grain,—frequently also on the top of a wall or old building, the bank of a paddy-field, or even a clod of earth or ant-hill, and it is by no means uncommon to see one on the back of cattle, sheep, or goats, while grazing. From this perch it watches eagerly for the stirring of an insect below; on observing one, it flies rapidly to the spot, and generally alighting for an instant on the ground, seizes its prey; frequently, however, the devoted grasshopper, or other insect, being also on the look-out, makes an attempt to escape, but is closely pursued by the king-crow, who either snaps it up on the wing or just as it has alighted. Having secured it, the Kolsa flies off generally, but not always to its former perch, devours it at leisure, and then uttering its usual cry, is again ready for

another capture. Such is the usual mode of feeding of this bird. It very frequently, however, captures various small insects on the wing, from the top of a tree or some lofty branch, sometimes ascending almost perpendicularly for several feet, occasionally whips one off a blade of grain, or from the surface of a pool of water. On the issuing of the winged termites from a nest in a hedge-row, or near the bottom of a tree, there are generally several assembled to partake of the feast, together with the crows and minas. This bird gets its popular name of king-crow, from its general habit of following crows most clamorously and perseveringly, every now and then pouncing down on them, though it seldom strikes. It pursues kites and various other birds also; whence one of its common Hindustani names (Kotwal). In the bare Decean I have often seen one or two king-crows high in the air, traversing the country, but apparently not hunting."

"The usual cry of this shrike, is a sort of crow or chuckle, succeeded by two or three sweeter notes; but it has several other cries. It is the first bird whose song is heard in the morning, often long before sunrise, and sometimes on moonlight nights throughout the whole night. Its flight is in general undulating, not very rapid, performed with few flappings; but when it exerts itself after a crow or other bird, it is capable of great speed, and always overtakes its enemy with ease. It occurs singly or in small families. I once found its nest, in the month of August, in the Carnatic, situated in the fork of a banian tree, at a moderate elevation: it was composed of twigs and roots, carelessly put together, and without any lining, and contained three eggs, white, sparingly spotted with purplish Its chief food is grasshoppers of various kinds, also bees, moths, and other insects, chiefly coleopterous. Mr. Elliott in his 'Notes' says, 'it migrates from the Southern Mahratta Country during the monsoon.' In the Carnatic I never observed any diminution in its numbers at any season, but in the northern part of the Decean (at Jaulnah), it certainly becomes much more rare at that time, and indeed is hardly met with. The Kolsa is occasionally tamed, and will perch on the head or hand of its master, and fly down after a grasshopper or other insect."-(Jerd., Madr. Journ. L. S. X. p. 238.)

Captain Tickell states, "The nest is made on summits of thick bushes, or midway up medium-sized trees; concealed in the trunk; hemispherical, 6 to 8 inches in diameter, of coarse grasses, fibrous roots lined with finer grass and wool. Eggs 3 to 5, ordinary

 $\frac{15}{16} \times \frac{11}{16}$ , dullish white, with scattered blots and spots of pale brown, especially at the blunt end. June."—(Journ. A. S. Beng. XVII. p. 804.)

- q. Bengal. From Bax's Collection.
- h. Kumaon. From Captain R. Strachey's Collection.

"This is the rarest of all the Indian Dicruri," observes Mr. Jerdon. "I have hitherto only seen it in the Segour pass, and on the summit of the Neilgherries, in both places on lofty and tolerably dense jungle. I observed it in the former place sally from its perch near the summit of a lofty tree, and make a considerable circuit, apparently capturing several insects, and then reseating itself on some other tree. Several birds were thus engaged together, though at some distance from each other, and returning separately each to its own perch. In this respect it makes a nearer approach than any other Indian species, to the manner of the African Drongo shrikes, as described by Le Vaillant, hunting in flocks like swallows, and mentioned by Swainson as being the general habits of the genus. Flight of this species similar to that of macrocercus, but more rapid and elegant."—(Madr. Journ. L. S. X. p. 210.)

Captain Hutton remarks: "This species, the only one that visits Mussoorce, arrives from the Doon about the middle of March, and retires again about September. It is abundant during the summer months, and breeds from the latter end of April till the middle of June, making a very neat nest, which is placed in the bifurcation of a horizontal branch of some tall tree, usually oak trees; it is constructed of grey lichens gathered from the trees, and fine seed-stalks of grasses, firmly and neatly interwoven; with the latter it is also usually lined, although sometimes a black fibrous lichen is used; externally the materials are kept compactly together, by being plastered over with spiders' webs. It is altogether a light and elegant nest. The shape is circular, somewhat shallow, and diameter within three inches. The eggs are three to four, generally the latter number, and so variable in colour and distribution of spots, that until 1 had shot several specimens and compared them narrowly,

I was inclined to think we had more than one species of Dierurus here. I am, however, now fully convinced that the sevariable eggs belong to the same species. Sometimes they are dull white with brick-red spots, openly disposed in form of a rude ring at the larger end; at other times the spots are rufescent claret, with duller indistinct ones appearing through the shell; others are of a deep carneous hue, clouded and coarsely blotched with deep rufescent claret; while again some are faint carneous, with large irregular blotches of rufous clay, with duller ones beneath the shell. Diameter varying from  $1 \times \frac{1}{16}$  to  $\frac{1.5}{16} \times \frac{1.5}{16}$  ins."—(Journ. A. S. Beng. XVII. pt. II. p. 687.)

"This species appears to be generally spread, but nowhere plentiful. It frequents open though lofty jungle, and well-wooded districts, but is occasionally met with in topes and avenues in the Decean and Carnatic. I have seen it most numerous in the Wulliar jungle and the Segour pass of the Neilgherries, where I found it at a considerable elevation. It almost always captures its insect prey on the wing (sometimes however picks one off the ground); it perches near the top of a high tree, whence it pounces on its prey generally at no great distance. It has a sweet song."—(Jerd., Madr. Journ. L. S. X. p. 239.)

HUZAR DUSTAN ('Bird of a Thousand Tales'), Jerd.

- A. and Drawing. Assam. Presented by J. McClelland, Esq.
- b. Tenasserim. Presented by the Asiatic Society of Bengal.
- c. Kumaon. From Captain R. Strachey's Collection.

"This splendid bird is tolerably abundant in many of the lofty jungles of the west of India, both above and below the ghauts, it being very plentiful in the Wynaud district. It appears to wander more in search of its food than other of the Dicruri, flying from tree to tree at no great elevation, making an occasional swoop at an insect on the wing, or whipping one off a branch; frequently, however, it feeds like its congeners, from a fixed station. generally hunts singly or in pairs, occasionally, however, it is seen in small parties. Its food is chiefly large colcopterous insects, also large bees and wasps. It has a very peculiar cry, consisting of two parts, the first a sort of harsh chuckle, ending in a peculiar metallic sound, something like the creaking of a heavy wheel. Mr. Elliott says on this subject, 'its general note is a deep sonorous cry, something like tse-rung, tse-rung, tse-rung.' It has many other notes besides this, all of which, however, have more or less clangor or metallic sound. I have seen it pursue a bird of prey (Hæmatornis cheela) in the same manner as the common king-crow. It moults about September. Although it chiefly inhabits lofty jungles, I have seen it in comparatively low jungle, and I am informed that it often enters gardens in the cantonment of Cannanore. The Bherm-raj is occasionally taken and tamed; it used to be very frequently in former days, and sold for a very high price at Hyderabad. It is said to imitate the notes of all other birds, and hence is also called the 'Huzar Dustan,' or bird of a thousand tales."—(Jerd., Madr. Journ. L. S. X. p. 241.)

Bajunga, Feetchkuna, and Cassraj, Sylhet, Dr. Cooke.

- A. Bootan. From Pemberton's Collection.
- b. Calcutta. Presented by the Asiatic Society of Bengal.
- c. Drawing. From Dr. F. (B.) Hamilton's Collection.
- d. Nepal. Presented by B. H. Hodgson, Esq., July, 1853.
- Dr. F. (B.) Hamilton's remarks on the habits of this beautiful bird inform us, "that it is common in the neighbourhood of Calcutta, and builds among the bamboos, living in pairs, and feeding on insects and fruits: remaining there throughout the year. It is said to sing well, and is frequently tamed by the Mussulmans, who in the morning carry it about, and invoke the name of God and the prophet, in the same manner as they do with Parakeets."
- "Mr. Cooke, surgeon at Sylhet, observes, 'that this bird is there called Bajunga, Feetchkuna, and Cassraj.' This last name is a corruption of Kishen-Raj, the vulgar pronunciation of its proper name. Mr. Cooke alleges, 'that it possesses the power of imitating the voice of other birds;' but this my native servants deny. He also says, 'that in the cold season this bird always visits the high mountains, but returns to the plains of Sylhet about the commencement of the rains.'"—(MS. I. p. 61.)

Lieutenant Tickell also remarks: "These birds are tolerably numerous, but confined to localities. They frequent the large timber which luxuriates in the lower portions and richer soil of the jungles on the banks of nullas, tanks, &c.: the cotton-tree, when in blossom, is a favourite resort, where they may be seen in small parties frolicking about. The voice is very changeable and in constant exertion, from a beautiful song to whistling, chattering, and

creaking like a rusty wheel. The notes at times resemble the higher strains of an organ, and, heard in the wild and lovely scenes where this bird is found, appear singularly striking and plaintive."—(Journ. A. S. Beng. II. p. 574.)

Mr. Hodgson states,\* "Its food is chiefly wasps, bees, and their congeners, also green beetles, and other colcoptera; very rarely vetches. Solitary or in pairs, part of the year in families, the young with the parents, never quitting the forests; descends from time to time from its lofty perch to seize an insect on the wing; occasionally seizes on the ground, but instantly retiring to its perch. Common to all the three regions of Nepal. Moults in autumn, between August and October, and, I think, only in autumn."—(Ind. Rev. I. p. 325.)

- A. Calcutta. Presented by the Asiatic Society of Bengal.
- b. Assam. Presented by J. McClelland, Esq.
- c. Purchased.
- d. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This species is always found in the dense and lofty jungle. I have only seen it in the forests of the western coast, and have met with it at an elevation of 4,000 feet. It is generally found in small parties, stations itself near the top of some lofty tree, whence it makes frequent short sallies after insects, exactly like the flycatchers, and returns generally to the same branch. It sings most charmingly, being perhaps only surpassed by the Gryllivora longicanda. Its food consists of various insects, both hard and soft-winged."—
(Jerdon, Madr. Journ. L. S. X. p. 240.)

Mr. Hodgson also remarks:\* "Shy, adhering to the forests, feeds chiefly on the softer-winged insects, which it takes on the wing exclusively, but not by continued questing; has an autumnal moult between August and October, and I think but one per annum."—(Ind. Rev. 1. p. 327.)

b. and Drawing. Presented by J. McClelland, Esq.

c. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This bird appears to be universally spread over India, but is by no means common. It prefers a wooded country, and always, I believe, takes its food, which consists chiefly of soft-winged insects, in the air. I saw a flock once flying over an open space in the

Wulliar jungle like swallows; again near Palamcottah, in a palmyra tope, a small flock of them, one every now and then darting from its perch on the top of a palm-tree, and making a short circuit in the air after insects, reseating itself, though not generally on the same tree. On another occasion I saw it in Travancore, skimming over the surface of a tank, and returning to rest on a low bough overhanging the water. Its flight is rapid, elegant, and remarkably like that of the swallow."—(Jerd., Madr. Journ. L. S. X. p. 237.)

"Wherever a high tree rises above its fellows, and projects a bare or dead branch, commanding a wide view around, there may commonly be seen a party of these birds, one minute sitting together in a close row, anon sallying forth in quest of insects, and soon returning (each separately and independent of the movements of the rest), to alight and perch together as before. Yet they are not very common, but the parties are met with here and there, sometimes at long intervals, through a tract of favourable country; but whenever they are seen, a number of specimens may be procured with the greatest facility."—(Blyth, Journ. A. S. Beng. XV. p. 299.)

a. Nepal. Presented by B. H. Hodgson, Esq., July, 1853.

"This Shrike is common in the open country in Nepal," says Mr. Hodgson, "in groves and gardens during winter, but resorts to the woods in summer. It feeds on all sorts of hard and soft (both flying and creeping) insects, and their larvæ and pupæ; also small lizards, feeble birds, mice, and almost any living thing the bird can master; perches on the upper and barer branches of trees and bushes, whence it descends to seize its prey on the ground; sometimes picks it from foliage, but very seldom seizes on the wing. Has a harsh voice, very like the kestril's, and is perpetually vociferating from its perch. It is bold and daring in its manners, and easily caught by any insect bait." \*—(Ind. Rev. I. p. 445.)

f. young. Tenasserim. From Helfer's Collection.

g. Drawing. From Heyne's Collection.

h. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This is one of the commonest of Indian birds, and as its particularly harsh chattering affords one of the earliest intimations of the advent of the cold season in Calcutta, its note is then far more acceptable than is warranted by the music of it. A few individuals, however, are procurable at all seasons within a few miles of Calcutta. This species is also common on the eastern side of the Bay of Bengal, extending southward to the straits."—(Blyth, Journ. A. S. Beng. XV. p. 303.)

"The word Curcutea is applied to several animals, and even children, that have strong harsh voices. This Shrike builds its nest in trees and bushes; feeds on insects, and attacks small birds."—(Dr. F. (B.) Hamilton, MS. I. p. 8.)

"Nest found in large bushes or thickets, shallow, circular, four inches in diameter, rather coarsely made of fine twigs and grass. Eggs 3 ordinary;  $\frac{2}{3}\frac{9}{2} \times \frac{2}{3}\frac{1}{2}$ ; pale rose-colour, thickly sprinkled with blood-red spots, with a darkish livid zone at the larger end. June."—(Tickell, Journ. A. S. Beng. XVII. p. 302.)

f. g. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"This Shrike is generally spread throughout Southern India, but in no place abundant, though it is far from being rare in some parts of the country, I having seen it most numerous in Goomsoor, and in the Wulliar jungle (in the gap of Coimbatore). Colonel Sykes says it is rare in the Deccan: this to be expected from the bareness of the country. It is found in open jungle, in open spaces on the borders of thick forests, woody nullahs, topes, avenues, and even thick hedges occasionally, but never in dense jungle. It may be observed slowly traversing the branches of the trees it frequents, in search of insects, chiefly coleoptera. Seen singly or in small flocks."—(Jerd., Madr. Journ. L. S. X. p. 236.)

"This species is much more common in the lower region of Nepal than in the central or northern."—(Hodgs., Ind. Rev. I. p. 447.)

"It is only found here (Nihinogor) in the cold season, and retires, it is supposed, to thick forests, where it breeds. They are found in small flocks of four or five pairs. Feeds on insects. It has a sharp cry when disturbed, but also sings with a fine mellow voice, and on this account is sometimes tamed."—(Dr. F. (B.) Hamilton, MS. II. p. 71.)

c. d. J. Nepal. Presented by B. H. Hodgson, Esq.

"This bird prefers well-wooded situations, though not a denizen of thick jungle; hence is most abundant in the western coast. It is also found in the other parts of India in topes, avenues, palm-groves, and occasionally even enters gardens. It lives partly on insects, chiefly mantides, grylli, caterpillars, and soft insects, which it searches for among the foliage of large trees; and partly on fruit, especially the fig of the banian-tree. It is rather a shy and wary bird, flying before you from tree to tree, uttering as it alights two or three rather sweet and mellow notes; but it has also a very harsh rattling scream. It flies in an undulating manner, with few vibrations of its wings. Its flesh is eaten and esteemed by some of the natives."—(Jerd., Madr. Journ. L. S. X. p. 242.)

"Habits, solitary for the most part, and adhering to the forests, but sometimes approaching gardens and orchards. Feeds on the ground as well as on the wing, and has a shrill voice, exactly like that of the Halcyons. Food, grilli, mantides, scarabæi, berries, vetches, and seeds."\*—(Hodgs., Ind. Rev. I. p. 327.)

- e. 9. Bootan. From Pemberton's Collection.

"This species is most abundant in woody country, in avenues, or thick hedges, gardens, &c. It is to be met with at all seasons of the year on the western coast, but I think only repairs to the Carnatic (I speak particularly of the country about Trichinopoly) after the commencement of the rainy season there, in October or November; at all events it is much more numerous then. This species hunts singly or in small families of both sexes, flying from tree to tree, slowly and carefully examining the foliage, prying searchingly all around, and under the leaves, to discover a suitable morsel. It continues its search hopping, flying from branch to branch, till the tree has been well inspected, when the flock flies off together to another tree. Its favourite food is caterpillars, pupæ, grubs, and soft insects; but also ants and coleopterous insects. females are much more numerous than the males; but this may partly be accounted for by the young males being clothed in the female garb."—(Jerd., Madr. Journ. L. S. X. p. 242.)

"Found only in thick bushes. Black ants only found in the stomach."—(Sykes, P. Z. S. 1832, p. 87.)

- c. J. Donor unknown.
- d. d. Tenasserim. From Helfer's Collection.
- v. f. g. h. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"This species is confined to the woods, and is solitary, or nearly so. I have procured abundance of specimens from all parts of the hills, and at all seasons of the year. Not migratory. Their principal food is caterpillars and other soft wingless insects; but many soft and hard flying insects are likewise taken, with grubs, larve, and insect eggs, and frequently stony berries, and even seeds. These birds, though they procure the greatest portion of their food on trees, yet freely descend to the ground to gather it there also." \*—(Hodgs., Ind. Rev. I. p. 328.)

"This is a mere summer visitor in the hills, arriving up to 7,000 feet, about the end of March, and breeding early in May. The nest is small and shallow, placed in the bifurcation of a horizontal bough of some tall oak-tree, and always high up; it is composed externally almost entirely of grey lichens picked from the tree, and lined with bits of very fine roots or thin stalks of leaves. Seen from beneath the tree, the nest appears like a bunch of moss or lichens, and the smallness and frailty would lead one to suppose it incapable of

<sup>\* &</sup>quot;The intestines are 10 to 11 inches long, of nearly equal calibre throughout, and having the cæca hardly traceable. The stomach is muscular and red, with an outer coat of medial unequal thickness, and a tough lining."—(Ind. Rev. I. p. 328.)

holding two young birds of such size. Externally the nest is compactly held together by being thickly plastered over with cobwebs. The eggs are two in number, of a dull grey-green, closely and in parts confluently dashed with streaks of dusky brown. Diameter  $\frac{1}{10} \times \frac{1}{10}$  inches. This bird has a plaintive note, which it repeatedly utters while searching through a tree, after the manner of Lanius Hardwickii, for insects."—(Hutton, Journ, A. S. Beng, XVII. pt. II. p. 688.)

Mountaineer Warbler, Lath.

Кетек, Java, *Horsf*.

A. B. & Q. Java. Dr. Horsfield's Collection.

"I met with the Ketek in one situation only, at an elevation of about 7,000 feet above the level of the ocean. It is probably found on all the mountain-peaks of Java, which are covered with thick forests, accommodated to its peculiar habits. The recurrence of several quadrupeds and birds, at a certain elevation, is as regular in this island as that of many plants and insects. Although local in its residence, it is very numerous on Mount Prahu, and in my daily excursions I uniformly observed, and occasionally surprised it in its short sallies among the openings of the forest. It is chiefly found on the lowest branches of trees or on the ground. The shortness of

its wings incapacitates it for elevated or distant flights, and its motions are low, short, and made with great exertion. It lives in the thickest coverts, here it forms its nest on the ground, and feeds on the larvæ of insects, worms, &c. This bird is a delightful resident in the forests of Mount Prahu, which, in the luxuriance of its vegetation and gloomy thickets, is probably not surpassed in any portion of the globe. It utters, almost without interruption, a varied song. Its common note is a quickly reiterated babbling, resembling that of the Sylvia curruca, Linn., and other birds of this family; it also has a protracted plaintive note, but it sometimes rises to higher and melodious warblings, which, in the general silence of these elevated regions, afford an inexpressible sensation of delight to the mind of the solitary traveller."—(Horsf., Zool. Res. in Java.)

"These birds never quit the forests, and usually adhere to those parts of them which abound in thick low brushwood. They seldom perch save at night, and then only on low bushes. They feed principally in swamps and rills, upon hard insects proper to such sites. Berries and seeds they seldom or never touch, and the sand occasionally met with in their stomachs, is probably taken unintentionally. Their tongue and intestines resemble those of the thrushes proper, with only a considerable increase in the length of the intestinal canal, which is sometimes thirty inches long. They fly so badly and are so stupid, that I have seen them taken by a single man."—(Hodgs., Journ. A. S. Beng. VI. p. 103.)

"Though by no means common, this bird is occasionally met with in gardens and topes in the Carnatic, as at Madras and Trichinopoly, during the cold weather only, I believe. It however generally frequents high jungle, and is therefore more common on the west coast than in other parts of the Peninsula; I have also seen it in Goomsoor. It feeds on the ground in small flocks, generally, but not unfrequently singly, and readily perches on being disturbed. In the few instances when I have obtained specimens of the *Nourung*, I have not found their food to consist of ants, but of other insects, chiefly colcopterous."—(Jerd., Madr. Journ. L. S. X. p. 251.)

"I kept a bird of this species for some time alive, but can remark little more than that it progressed by hopping, and that it is a remarkably silent bird, though I am told that it frequently utters a screeching note in the wild state."—(Blyth, Journ. A. S. Beng. XII. p. 960.)

- g. Q. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

Colonel Sykes remarks of Pandoo, that "this bird differs from the Solitary Thrush of Europe (Turdus cyaneus, Linn.) in its smaller size, slighter form, brighter carulean tint, want of orange eyelids, and white tips to the feathers. Found only in the dense woods of the Ghauts. Flight, low and rapid." Of the Maal he states: "This bird corresponds as closely as possible with what is stated to be the female of the Turdus cyaneus, and may by analogy be supposed to be the female of Pet. Pandoo; but it inhabits only the prickly milk-bushes (Euphorbia tortilis and pentagona) of the rocky plains of the Dukhun. I never saw it in the Ghauts, nor in company with Pet. Pandoo."—(P. Z. S. (1832), p. 87.)

"This is a rare bird in the southern part of the Peninsula. have only seen it on the Neilgherries, near Coonoor and Kotagherry, in bushy and rocky valleys. Towards the more northern parts, it becomes more frequent. I observed it several times about the central part of the table-land, both in the neighbourhood of villages, and in rocky valleys and hills. About Jaulnah it is far from being uncommon, frequenting chiefly the old mud walls of villages, and rocky hills, and occasionally seen about houses and stables in cantoument, perching now and then on the house-tops. I first observed it in the beginning of October, coming in at the same time with many other birds, and it stays here (at Jaulnah) till April. It is always solitary; feeds on various insects. I have found the Pet. Maal in the same localities as Pet. Pandoo, and consider it as the young bird or female, which is also the opinion of Mr. Elliot. From his 'Notes' I take the following extract: 'Very tame, often coming into houses and hopping about the verandah; has a fine song, and is trained and domesticated by faqueers and others; common on the coast from Vingorlah to Cambay." "The present species is a hill- but not a rock-bird, frequenting the tops of trees in the forests, and it extends its range to all India in suitable localities, being met with occasionally, but rarely, in the

plains during the seasons of passage, at which period (that of vernal migration) I once obtained one in the vicinity of Calcutta, which I kept for some time alive. Its song is sweet, plaintive, and tolerably loud, delivered in the manner of a Robin's song, and its manners are very like those of a Stone-chat."—(Blyth, Journ. A. S. Beng. XVI. p. 152.)

Mr. Jerdon observes: "I have hitherto only met it perched on trees in dense and lofty jungle in the Coonoor pass of the Neilgherries, on the summit of the hills near Coonoor, and once in the jungles of Malabar, at no great elevation above the sea. On one occasion only I observed three or four together; at all other times it was solitary. Its stomach contained various fruit and berries."—(Madr. Journ. L. S. X. p. 252.)

e. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This Thrush is to be found the whole year in the neighbourhood of Calcutta, but is not very common. It feeds upon insects and small wild fruits."—(Dr. F. (B.) Hamilton, MS. I. p. 14.)

"Arrives at Mussoorce at an elevation of five thousand feet about the end of May, and returns to the plains in autumn. It breeds in June, placing the nest in the forky branches of lofty trees, such as oak and wild cherry. Externally, it is sometimes composed of coarse dry grasses, somewhat neatly interwoven on the sides, but hanging down in long straggling ends from the bottom. Within this is a layer of green moss, and another of fine dry woody stalks of small plants, and a scauty lining at the bottom of fine roots. The eggs are three to four in number, pale greenish freekled with rufous; the spots of that colour confluent, and forming a patch at the larger end. Diameter,  $1_{\frac{1}{16}} \times \frac{1}{16}$  inches. Somewhat gibbons at the larger end." "These are not rock-lovers at all, but true forest birds, building in trees, and taking their food upon the ground, where they find it in berries and insects among the withered leaves, which they expertly turn over with their beaks, and hence the reason why the beak is almost invariably clotted with mud or other dirt. I have never seen these birds except in woods."—(Hutton, Journ. A. S. Beng. XVII. part 11. pp. 682, 685.)

"Shy, silent, solitary, frequenting thickets in rocky jungles."—(Tickell, Journ. A. S. Beng. II. p. 577.)

"The following notes respecting this species, transmitted to me by M. Middendorff of St. Petersburgh, will be read with interest. I first met with small flocks of this bird during the second week in April, near the river Aldan, in South-eastern Siberia, at about  $60\frac{1}{2}$ ° north latitude. They were mingled with and passing through flocks of Turdus fuscatus. About the end of April they began to couple. They frequented the densest branches of the coniferous and other trees, and while perched on the tops of the lofty larches, the males gave utterance to sweet songs, which called to my memory the melody of our Turdus musicus. Upon proceeding still farther into the country in a south-eastern direction, I lost sight of this interesting bird, and it is to be presumed that it does not occur on the eastern slope of the Stanowój range.'

"Pallas states that he frequently observed it in the lofty larenforests of Danuria, especially in the neighbourhood of the river Condam, passing in vast flocks to its winter-quarters, to which hunger compelled it to proceed through the snow-storms. At other times it dwells in the densest and most remote solitudes of the forest."—(Gould, Birds of Asia.)

"Like the Oreocinela varia, this bird never descends into the plains, but conceals itself in the forests which cover the mountains and hills, from an elevation of 4,000 to 6,000 feet above the level of the ocean. It has a more extensive range than the Or. varia, but it is very rarely observed, living retired in the closest forests. During my residence in Java, I obtained only three individuals of this species. Its food consists almost exclusively of berries."—(Horsf., Zool. Res. in Java.)

c. d. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"This is very common throughout the Himalaya, frequenting the beds of streams in the lower ranges; and its musical whistle (according to Mr. Vigne) is the sweetest note heard in the hills."—(Blyth, Journ. A. S. Beng. XVI. p. 154.)

"On the 16th June," observes Captain Hutton, "I took two nests of this bird, each containing three eggs, and another one containing three nearly fledged young ones. The nest bears a strong resemblance to that of the Geocichlæ, but is much more solid, being composed of a thick bed of green moss externally, lined first with long black fibrous lichens, and then with fine roots. Externally the nest is  $3\frac{1}{2}$  inches deep, but within only  $2\frac{1}{2}$  inches; the diameter about 43 inches, and the thickness of the outer or exposed side is 2 inches. The eggs are three in number, of a greenish ashy, freckled with minute roseate specks, which become confluent and form a patch at the larger end; shape ordinarily, and rather gracefully, ovate; diameter  $1_{16}^{6} \times \frac{15}{16}^{6}$  in. The elevation at which the nests were found was from 4,000 to 4,500 feet; but the bird is common, except during the breeding season, at all elevations up to the snows, and in the winter it extends its range down into the Doon. In the breeding season, it is found chiefly in the glens, in the retired depths of which it constructs its nest; it never, like the Thrushes and Geocichlæ, builds in trees or bushes, but selects some high towering and almost inaccessible rock, forming the side of a deep glen, on the projecting ledges of which, or in the holes from which small boulders have fallen, it constructs its nest, and where, unless when assailed by man, it rears its young in safety, secure alike from the howling blast and the attack of wild animals. It is known to the natives by the name of 'Kuljet,' and to Europeans as the 'Hill Blackbird.' The situation in which the nest is placed is quite unlike that of any other of our Hill Thrushes with which I am acquainted. It is as often found in open rocky spots on the skirts of the forest, as among the woods, loving to jump upon some stone or rocky pinnacle, from whence he sends forth a sort of choking, chattering song, if such it can be called, or, with an up-jerk of the tail, hops away with a loud musical whistle, very much after the manner of the Blackbird (M. vulgaris)."—(Journ. A. S. Beng. XVII. pt. 2, p. 684.)

## a. Drawing. From Edward Blyth, Esq.

The following notice, by Mr. R. W. G. Frith, of a specimen of this bird in confinement, is given by Mr. Blyth, J. A. S. Beng. XII. "The bird was excessively tame and familiar, and p. 179 bis. delighted (like a cockatoo) in being caressed and tickled by the hand, when it would spread out its wings and assume very singular attitudes. It was naturally a fine songster, and a most universal imitator. Whenever chopped meat or other food was put into its cage, it always evinced the propensity to deposit the bits one by one between the wires (a habit in common with the shrikes, and which is also strikingly manifested by the Kitta venatorius, and sometimes even by Mynahs); and when a bee or wasp was offered, this bird would seize it instantly, and invariably turn its tail round and make the insect sting this several times successively, before eating it. large beetle it would place before it on the ground, and pierce it with a violent downward stroke of the bill; a small snake (about a foot long) it treated in like manner, transfixing the centre of the head, it afterwards devoured about half the snake, holding it by one foot, while it picked it with the bill, as was its common mode of feeding."

"This is very common in Mussoorce at all seasons, and congregates into large and noisy flocks, turning up the dead leaves, and screaming and chattering together in most discordant concert. It breeds in April and May, placing the nest in the forks of young oaks and other trees, about 7 or 8 feet from the ground, though sometimes higher, and fastening the sides of it firmly to the supporting twigs by tendrils of climbing plants. It is sometimes composed externally almost entirely of such woody tendrils, intermixed with a few other twigs, and lined with black hair-like fibres of mosses and lichens; at other times it is externally composed of coarse dry grasses and leaves of different kinds of orchis, and lined with fibres, the materials varying with the locality. The eggs are of a deep and beautiful green, shining as if recently varnished, and three in number; in shape, they taper somewhat suddenly to the smaller end, which may almost be termed obtusely pointed; the diameter,  $1_{16}^{3} \times \frac{14}{16}$  inches. The usual number of eggs is three, though they vary sometimes to one or two; but only on one occasion out of more than a dozen nests, have I found four eggs. The old bird will remain on the nest until within reach of the hand."-(Hutton, J. A. S. Beng. XVII. pt. II. p. 6.)

Laughing Thrush of the Neilgherries, Jerd.

### A. B. Madras. From Wight's Collection.

"This noisy bird is to be met with in all the thick woods on the summit of the Neilgherries, and its loud laughing call is often heard when the bird itself remains unseen. I have met it in no other locality. It is sometimes seen in small flocks, but often wanders about alone, though at no great distance from some of its species, with whom it continually keeps up a noisy communication as signal of the direction it is going, or of the abundance of food obtained. They keep chiefly to the lower branches of trees and brushwood; on being observed, they hop and climb up the stem and thick branches of the nearest large tree, but they do not appear to ascend to the tops of trees. I occasionally, though rarely, observed them hopping and feeding on the ground. They fly heavily, and never to any distance. The cry of the laughing thrush is very peculiar, and, once heard, cannot be forgotten; it has a sort of cracked Punch and Judy laugh, and is no sooner commenced by one than several others take up the chorus. The chief food is fruit of various kinds, especially the pleasant fruit of the Brazil cherry (Physalis tomentosa), now so abundant in most of the woods in the neighbourhood of Ootacamund. It also occasionally feeds on caterpillars and other soft-bodied insects. On one occasion, I found the nest on a bank overhanging the road, on the top of the Nediwuttum Ghaut of the Neilgherries. It was made of roots, grass, and moss, and contained four long oval pure white eggs."—(Jerd., Madr. Journ. L. S. X. p. 255, et Ill. Ind. Orn.)

- A. Bengal. From Bax's Collection.
- b. Nepal. Presented by B. H. Hodgson, Esq.
- c. Kumaon. From Captain R. Strachey's Collection.

"This bird is met with in pairs, sometimes in a family of four or five, and may be seen under every bush. The nest is placed near the ground in the midst of some thick low bush, or on the side of a bank amidst overhanging coarse grass, and not unfrequently in exposed and well-frequented places; it is loosely and rather slovenly constructed of coarse dry grasses and stalks externally, lined sometimes with fine grass, sometimes with fine roots. The eggs are three in number, and in shape and size exceedingly variable, being sometimes of an ordinary oval, at others nearly round. Diameter varying,  $1\frac{2}{16} \times \frac{13}{16}$ , or 1 inch  $\times \frac{11}{16}$ , or  $\frac{14}{16} \times \frac{11}{16}$ ; the most usual measurement, however, is the second one, or 1 inch  $\times \frac{14}{16}$  inches."—(Hutton, Journ. A. S. Beng. XVII. pt. II. p. 7.)

The birds composing the above genera of this sub-family "are gregarious, noisy, and alert. They frequent the deep and dank forests and groves exclusively; procure the greater part of their food on the ground; use the trees but for security when disturbed, for nidification, and for occasionally eking out their repasts with berries, pulpy fruits, and caterpillars, and are, for the most part, incapable of a sustained flight. Their habitat is very extensive, since they are almost equally common in the southern, central, and northern regions of Nepal and the Himalayas, and in the valleys alike, as on the tops of the mountains. In all situations, however, woodlands are indispensable to them, both for food and shelter, especially the latter, their retreat being a mere succession of hops from tree to tree, after the manner of the magpies. Most of them have a good deal of the mixed weariness and familiarity, as well as of the noisiness and congregational habits of the Corvida; and, though they never quit the deep woodlands, those persons who pass through such places perpetually encounter them on the roads and pathways, to which these birds are attracted by the dung of cattle, for the grain, larvæ, and insects it affords them. They are, on the whole, rather insectivorous than frugivorous, baccivorous, or graminivorous; but they eat a deal of grain and hard seeds, with gravel to digest it, and must, from the universality of their regimen, be classed among the omnivores. They are distinguished from the Thrushes by their avoidance of rills and swamps, and they are more capable of a graminivorous diet than that group. They scrape the earth with their bill, and sometimes also with their feet, in the manner of the Rasores. Many of the species are caged and tamed with facility, and they are more often turned loose into walled gardens, whence they soldom attempt to escape, if there be a considerable number of trees, and where they are of great service in destroying pupe, larvæ, and perfect insects, especially those which are generated, or feed, in manure.

In the Minister's garden at Cathmandu, there were always several scores of G. leucolophus; and in that of his nephew, many individuals of each of the following species, G. albogularis, moniligera, ocellatus, P. erythrocephalus, and T. rufogulare."—(Hodgson, As. Res. XIX. p. 144.)

## A. B. Nepal. Presented by B. H. Hodgson, Esq.

"These birds inhabit the northern region of Nepal, close to the perpetual snows. They are shy foresters, adhering to the wilds, and tenanting the skirts of forests, where brushwood as well as trees abound. Five or six birds are usually found together, chattering, hopping, and scraping on the ground, and resorting to the trees and shrubs chiefly for shelter. Their food is principally insects of the soft and imperfect kind in summer, but in winter they doubtess take some vegetable food."—(Hodgs., J. A. S. Beng. X. p. 857.)

Spotted Ground-Thrush, Gould.

### a. 3. Australia. From Mr. George Fradgley.

"This bird is distributed over the whole of Van Diemen's Land and the eastern portion of Australia, from Moreton Bay to Spencer's Gulf, to the westward of which I have never been able to trace it, and I have therefore reason to believe that this is the limit of its range in that direction. It is everywhere a stationary species. During my researches in South Australia, I found it sparingly dispersed over the country, in such localities as are suitable to its habits, between the great bend of the Murray and Lake Alexandrina; this, therefore, would seem to be the border-line of their range on either hand.

"The Spotted Ground-Thrush gives a decided preference to low stony hills and rocky gullies, particularly those covered with scrubs and grasses. Its flight is very limited, and this power is rarely employed except for the purpose of crossing a gully or passing to a neighbouring shrub. It readily eludes pursuit by the facility with which it runs over the stony surface, and conceals itself among the underwood. When suddenly flushed, it rises with a loud burring noise, like the Quail or Partridge. Its short flight is performed by a succession of undulations, and is terminated by the bird pitching abruptly to the ground almost at right angles. It seldom perches on the smaller branches of trees, but may be frequently seen to run along the fallen trunks so common in the Australian forests. Its note merely consists of a low piping whistle, frequently repeated while among the underwood, and by which its presence is often indicated. In Hobart Town it is frequently exposed for sale in the markets with Bronze-winged Pigeons and Wattle-birds, where it is known by the name of Ground Dove, an appellation which has doubtless been given both from its habit of running and feeding on the ground like the Pigeons, and the circumstance of its flesh being very delicate eating: to its excellence in this respect I can bear testimony. The pectoral muscles are very largely developed, and the body, when plucked, has much the contour of a Quail. The duty of incubation is performed in October and the three following months, during which period two and often three broods are produced. The nest is a slight and rather careless structure, composed of leaves and the inner bark of trees, and is of a round and open form. It is always placed on the ground, under the shelter of a large stone, stump of a tree, or a tuft of grass. The eggs are two, and sometimes three, one inch and three lines long, and are white, blotched with large marks of olive-brown, particularly at the larger end, some of the spots appearing as if on the inner surface of the shell. The young, which at two days old are thickly clothed with long black down, like the young of the genus Rallus, soon acquire the power of running, and at an early age assume the plumage of the adult, after which they are subject to no periodical change in their

appearance. The stomach is very muscular, and in those dissected were found the remains of seeds and caterpillars, mingled with sand."—(Gould, Birds of Australia.)

c. d. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"At Mussooree this bird remains at an elevation of 7,000 feet throughout the year, but I never saw it under 6,500 feet. Its loud, ringing note of titteree-titteree tweey, quickly repeated, may constantly be heard on wooded banks during summer. It breeds in May, making a neat nest of coarse dry grasses as a foundation, covered laterally with green moss and wool, and lined with fine roots. The number of eggs I did not ascertain, as the nest was destroyed when only one had been deposited, but the colour is pale bluish-white, freekled with rufous. The nest was placed on a branch of a plum-tree in the botanical garden at Mussooree."—(Captain Hutton, Journ. A. S. Beng. XVII. part II. p. 687.)

JUNGLI KÚR, Hind., Jerd.

A. Madras. From Wight's Collection.

"This species is only found in thick jungle. I have seen it in the bamboo jungles of the Wynaad, near Manantoddy, and along the edges of the Western Ghauts, and once at Coonoor, on the edge of the Neilgherry Hills. It has similar habits to the others, feeding on the ground, and on being disturbed retreating to the thick clumps of bamboos, through which they make their way with much adroitness, chattering all the while, and generally contrive to conceal themselves from view. Their note is similar in character, though quite distinct from any of its congeners."—(Jerd., Madr. Journ. L. S. X. p. 259.)

KOKUTTEE, Mahr., Sykes.

## A. b. Dukhun. Presented by Colonel Sykes.

"The Ghoghoge has a peculiar distribution. In the south of India it is only found on the elevated table-lands; I have observed it on the Neilgherries near Coonoor and Kotagherry, in low bushy ground, and seen specimens from the Shevaroy Hills near Salem. It is not found in the Carnatic, Northern Circars, nor in the more southern parts of the Deccan, but towards the north begins to occur more frequently, and at Jaulnah is very common. It frequents topes in the neighbourhood of villages and cultivation, also occasionally low and open jungle. Lives in small troops, feeding chiefly on the ground, especially around the trunks of large trees. It keeps up a

continual chattering, occasionally changed to a louder cry, resembling 'quey, quey, quey, quo, quo,' pronounced very gutturally. Its flight is feeble and straggling. Mr. Elliott says: 'When the Shikra (Micronisus badius) is flown at them, they defend each other with great courage, mobbing the hawk, and endeavouring to release the one she has seized.' Feeds on various grains, seeds, and insects, chiefly grasshoppers; I have seen one attempt in vain to catch a grasshopper on the wing."—(Jerd. Madr. Journ. L. S. X. p. 257.)

"Congregates in flocks of ten or a dozen, flying low, slowly, and with difficulty; never ceases chattering, and all at the same time."—(Sykes, P. Z. S. 1832, p. 88.)

"A most abundant and conspicuous species in Bengal and Nepal. This is the Sat Bhai, or Seven Brothers, of the natives, so called from being always found in a company of about that number. It is one of the most chattering, noisiest birds in India, squeaking and hopping about, now on the ground, then upon a tree, the flock being constantly on the move; when one starts, all the rest follow it, one after another, making generally but a short flight of not more than forty or fifty yards at a time, and when alighted they hold a sort of consultation, hopping about and chattering all the time, till after a few minutes they move off to another tree, and so on for the greater part of the day, rarely staying for more than half an hour in the same place. They feed on insects."—(Pearson, J. A. S. B. X. p. 650.)

# A. S. India. Presented by the Asiatic Society of Bengal.

"The White-headed Babbler is found throughout the Carnatic, extending on the one side into the Northern Circars, and on the west into the neighbouring portions of the table-land, to a greater or less distance. It is extremely common and abundant in the Carnatic, and is to be found in every hedge, avenue, and garden. Like the others of its genus, it always associates in families of six, seven, eight, or more; even in the breeding season, the parent birds feeding in company with their former companions. One may be seen suddenly dropping to the ground from some tree, and is followed in succession, though perhaps not immediately, by each of the flock. They hop about, turning over fallen leaves, and examining all the herbage around the base of trees, a very favourite spot, or on a hedge-side, never venturing to any distance from cover, being aware of their tardy powers of flight. They are occasionally seen seeking insects or grain from heaps of dung, whence they have received their common denomination, as well from the French (Fouille-merde), as from the English (Dirt-bird), who are on this account prejudiced against them. They generally feed at some little distance apart from each other, but now and then, if a richer prize than usual is spied out, two or more will meet and struggle for it; and now and then, one of them will make a clumsy flight after a grasshopper, seeking safety by its wings, and not unfrequently eluding its awkward pursuer. On being driven from the ground, or leaving it from choice, their hunger being satisfied, they fly up to the nearest tree, hopping

and climbing up the larger branches, and if you happen to be watching them, they do not stop till they have reached the top, or the opposite side, whence they fly off in single and extended file as They often appear to pick insects off the branches of trees. They are familiar, if undisturbed, feeding often close to houses, but if watched or followed, they become circumspect, disperse, and hide Their cry is a loud sibilous or whispering sort of chatter, which they repeat all at once, sometimes when feeding, or when any unusual sight attracts their attention, and often without any apparent object at all. They have no song. Their flight is slow and laborious, performed by a few rapid strokes of the wings, alternating with a sailing with outspread pinions. I have often found the nest of this bird, which is composed of small twigs and roots carelessly and loosely put together, in general at no great height from the ground: it lays three or four blue eggs. I have found them breeding at all times from January to July, and even later, but do not know if they ever have two broads in the year. The Black and White Cuckoo (Oxylophus edolius) appears to select this bird to act as foster-parent to her own progeny, and she lays a greenish-blue egg. They are readily caught by a spring trap, baited with grain, with one of their kind put in the centre as a lure. The Shikra or Chipka (Micronisus badius) is sometimes flown at them, and causes a general consternation; after the first burst of alarm and gabbling, they cease their chattering, separate, and disperse, and do not, like the bolder Mahratta Babbler (M. Malcolmi), come to the rescue of their unfortunate companion."—(Jerd. Ill. Ind. Orn.)

Thicket Warbler, Tickell.

A. Dukhun. Presented by Colonel Sykes.

b. c. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"This curious little bird," observes Mr. Jerdon, "I have met in the jungles of Trichoor, Wurguneherry, and Manantoddy; but it is by no means common. It associates in small flocks, among the low shrubs and thickets in lofty jungle, descending to the ground, where it hops about in search of various insects, and from thence running up and climbing the small branches, keeping up a continual chattering, and every now and then one of them, perched on a low bough, elevating his head and neck, and giving utterance to a sort of crowing laugh, very similar to that of *Pterocyclus cachinnans*. On being disturbed, they retreat through the trees and underwood, at no great height from the ground; and indeed they never appear to climb to any height."—(Madr. Journ. I. S. X. p. 255.)

Colonel Sykes remarks, "Black ants only found in the stomach."

"This is not unfrequent in the groves and small woods which abound in every part of Java. It often approaches the villages and plantations, and it constructs its nest in the hedges; it is one of the social birds which delight to dwell in the neighbourhood of culti-

vation. In large forests, I have not observed it. Its flight is low and interrupted. Wherever it resides it is a welcome neighbour, in consequence of the peculiarity and pleasantness of its note. This consists of a slow repetition of the five tones of the diatonic scale (C D E F G), which it chants with perfect regularity, several times in succession, and at small intervals of time. The sixth tone is sometimes added; but as this requires apparently an extraordinary effort, it is by no means so agreeable to a musical ear as the simple repetition of five notes, which appears to be the natural compass of the organs of the bird."—(Horsf. - B. Bengal. Presented by the Asiatic Society of Bengal.
- c. Darjeeling. From Pearson's Collection.
- d. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"This appears to be generally diffused throughout India. It is far from being common towards the south of the Peninsula. I have seen it in a bushy tract at the edge of the Wulliar jungle; also in hedges on low jungly districts near the base of the Shaudee Mungalum hills, in the Salem district, and again at Royacottah, in similar situation. Near Jauluah, it is generally to be met with in the low jungle in the neighbourhood, also in woody nullahs and thick hedges. It is not unfrequently to be seen alone, but generally in small parties of four or five, which fly before you, and manage to conceal themselves in some thick bush. They have a low chattering when together, neither loud however, nor often heard. I have on several occasions heard a single one, perched conspicuously on a bush or hedge, pour forth a remarkably sweet song. Feeds on ants and various other insects, &c."—(Jerd., Madr. Journ. L. S. X. p. 261.)

Mr. Blyth remarks, "I possessed some of these birds alive, and noticed that they frequently placed one foot upon their food, while they picked it with the bill."—(Journ. A. S. Beng. XI. p. 199.)

Mountain Creeper, Lath.

Bokkrek, Java, Horsf.

A. b. Java. From Dr. Horsfield's Collection.

c. Malacca. Presented by W. Griffith, Esq.

"This is found in Java, exclusively in mountain forests that have an elevation of about 7,000 feet above the level of the ocean. It never migrates from these into the lower regions. Although necessarily confined in its range, and limited to the distant conical summits of a series of mountains that extends longitudinally through the island, it is very abundant in particular places. I met with it at several points; but the cold climate of the mountain Merbaboo, one of the highest peaks in the central part of Java, and the summit of Mount Prahu, both of which exceed the elevation above mentioned, appeared its favourite places of residence; here it builds its nest on high trees. Its food is plentifully supplied by the berries of various species of Rubus, as well as by the fruits of numerous vegetables, which cover these elevated districts. About the middle of the day,

this bird is seen, through the openings of the forest, in small flocks; it then emits incessantly a loud note, in imitation of which the natives have applied to it the name of Bokkrck."—(Horsf. Zool. Res. in Java.)

- a. b. Bootan. From Pemberton's Collection.
- c. Nepal. Presented by B. II. Hodgson, Esq.
- d. Kumaon. From Captain R. Strachey's Collection.

"Common from 3,500 feet up to 10,000 or 12,000 feet; always in pairs, turning up the dead leaves on copsewood-covered banks; uttering a loud whistle, answering and calling each other. It breeds in April, constructing its nest on the ground, of coarse dry grasses and leaf-stalks of walnut-trees, and is covered with a dome-shaped roof, so nicely blended with the fallen leaves and withered grasses among which it is placed, as to be almost undistinguishable from them. The eggs are three in number, and pure white; diameter  $1_{10}^{2} \times \frac{13}{6}^{2}$  inches, of an ordinary oval shape. When disturbed, the bird sprung along the ground with long bounding hops, so quickly that, from its motions and the appearance of the nest, I was led to believe it a species of rat. The nest is placed in a slight hollow, probably formed by the bird itself."—(Hutton, J. A. S. B. XVII. pt. 2, p. 10.)

The White-eyebrowed Pomatorhinus, Gould.

GNOW-UN, Aborigines, W. Australia, Gould.

a. Australia From Mr. George Fradgley.

"This species ranges over the whole of the southern portion of the continent of Australia, where it must be regarded as a bird peculiar to the interior rather than as an inhabitant of the districts near the coast. It is common on the Liverpool Plains in New South Wales, and it was particularly noticed by my friend Captain Sturt during his expedition to the Darling. I myself encountered it near the bend of the river Murray, and it has also been found in the York district of Western Australia, but I have never heard of its having been seen either in the north or north-western parts of the country. It usually moves about in small troops of from six to ten in number, and is, without exception, the most restless, noisy, querulous bird I ever encountered. Its mode of progression among the branches of the trees is no less singular than is its voice different from that of other birds; it runs up and down the branches of the smaller trees with great rapidity, and with the tail very much spread and raised above the level of the back. It usually feeds upon the ground, under the Banksias and other low trees, but upon the least intrusion flits on to the lowest branch, and by a running or leaping motion quickly ascends to the highest, when it flies off to the next tree, uttering at the same time a jarring, chattering, and discordant jumble of notes, which are sometimes preceded by a rapidly-repeated shrill piping whistle. When a troop are engaged in ascending the branches, which they usually do in line, they have a singular habit of suddenly assembling in a cluster, spreading their tails and wings, and puffing out their plumage until they resemble a complete ball of feathers.

"The breeding season commences in September, and continues during the three following months. The nest is a large doomed structure of dried sticks, with an entrance in the side, which is hidden from view by the sticks of the upper part of the nest being made to project over it for four or five inches, like the thatch of a shed; the inside is generally lined with the soft parts of flowers and the dust of rotten wood, but occasionally with feathers. In Western Australia the nest is usually constructed in a dead jam-tree, the branches of which are drawn together at the top like a broom. It often happens that three or four pairs of birds build their nests in the same small clump of trees. The eggs are four in number, the ground colour being olive-grey clouded with purplish brown, and streaked with similar hair-like lines of black; they are eleven and a half lines long, by eight lines broad."—(Gould, Birds of Austr., IV.)

- f. Drawing. From Dr. F. (B.) Hamilton's Collection.

"This sprightly and pleasing bird is in general found in the Peninsula, only in lofty jungle, as well as on the east coast (as in Goomsoor), as the west coast, but I have also seen it in low bushy ground on the sea-coast, between Calicut and Telicherry, and it is most abundant on the summit of the Neilgherries, in gardens and shrubby ground. It is a most lively and active bird, always on the move, and warbling its pleasant chirruping notes, which are much sweeter than those of the common Bulbul. It lives chiefly on fruit and seeds, but also on insects occasionally, which I have seen it picking off the ground. Its flight is steady, but not rapid, and its crest is never creeted during flight, but always the moment it alights. A deserted nest was pointed out to me in a low shrub close to a house in Ootacamund, as that of this bird; it was very neatly made with moss, lichen, small roots and twigs, and well lined with hair and down."—(Jerd., Madr. Journ. L. S. X. p. 250.)

"These birds are in great request among the natives, being of a fearless disposition, and easily reclaimed. They are taught to sit on the hand, and numbers may thus be seen in any Indian bazaar."—(C. W. Smith's Notes, J. A. S. Beng. X. p. 640.)

<sup>&</sup>quot;This is one of the most common and abundant birds of India,

frequenting both gardens and cultivated ground, and low bushy jungle. It is never found in dense jungle. It is found even on the Neilgherries at Coonoor and Kotagherry at 6,000 feet of elevation; but I have not observed it in the more elevated and central parts of the hills. It lives in pairs or small families; feeds chiefly on fruits, being destructive to peas and other garden produce, but also occasionally on insects, frequently repeating its usual notes while hopping about the branches and wandering from tree to tree. It flies in a direct manner, with a quick flapping of its wings, and usually uttering its note when on the wing. It is very commonly eaged in the Carnatic, and kept for fighting, which it does with some spirit, and it is said that the antagonists often seize each other by the red under tail-coverts, and endeavour to pull them out; it is also said to imitate the notes of various other birds in confinement."—(Jerd., Madr. Journ. L. S. X. p. 249.)

#### 357. PYCNONOTUS ARSINOE, Lichst.

The White-cheeked Pycnonotus, Gray.

A. B. Bootan. From Pemberton's Collection.

c. d. Nepal. Presented by B. II. Hodgson, Esq., June, 1853.

"Common in the Doon throughout the year, and in the hills during the sammer. It breeds in April and May. The nest is neat and cup-shaped, placed in the forks of bushes or pollard trees, and is composed externally of the dried stalks of 'Forget-me-not,' lined with fine grass stalks; eggs three to four, rosy or faint purplishwhite, thickly sprinkled with specks and spots of darker rufescent purple or claret colour; diameter  $\frac{1}{16} \times \frac{1}{16}$  inches; diameter of nest  $2\frac{1}{2}$  inches, and  $1\frac{1}{2}$  inches deep. Sometimes the outside of the nest is composed of fine dried stalks of woody plants, whose roughness causes them to adhere together."—(Hutton, J. A. S. B. XVII. pt. 2, p. 10.)

# 361. PYCNONOTUS GOIAVIER, Scop. Sp.

Muscicapa goiavier, Scopoli.

Kaha Korulla ('Saffron-coloured Bird'), Ceylon, Layard.

- A. Siam. From Finlayson's Collection.
- b. Presented by the Asiatic Society of Bengal.

"This is a widely dispersed, though not very common bird, except in some few localities. It prefers a wooded district. I have found it in Goomsoor in open jungle; in the Carnatic seldom, and only in the vicinity of jungle, in thick hedges and bushy nullahs; in the neighbourhood of Coimbatoor; in low thickets in the Wulliar jungle, and very abundant in a bushy track along the west coast. It flies actively along from bush to bush, hiding itself in the thickets; has a loud, clear, thrush-like warble, and feeds entirely on fruit of various kinds."—(Jerd. Madr. Journ. L. S. X. p. 249.)

"Found in woody and barren country at Bamireah, near Mednapur; appeared shy, silent, and solitary, and partakes of the nature of the fly-catchers and thrushes. It flies and settles about the lower parts of bushes and thickets. Stomach contained berries and seeds."—(Tickell, J. A. S. Beng. 11. p. 573.)

#### 363. PYCNONOTUS SIMPLEX, Less.

Ixos vidua, Temm., Mus. Lugdunens. Bonap., C. G. Av. p. 264 (1850).

MIRBA TANDO, Eyton, LABAM, Malay, Blyth.

a. b. J. Malacca. Presented by W. Griffith, Esq.

c. 2. Malacca. Purchased.

## 375. MICROTARSUS OLIVACEUS, Moore.

Length 6½ inches, of wing 3 inches, and tail 2½ inches, bill to gape ½ of an inch, and tarse the same. Colour of the upper parts, olivebrown faintly shaded with dull green; wings and tail more uniform brown, slightly margined on the outer vanes with brightish green; lores and car-coverts olive-brown; beneath, uniform dasky ash-colour, with a tinge of yellow on some of the feathers, purer on the throat, belly, and under tail-coverts; darker on the breast and flanks, with a light purplish shade. Bill and feet horn-colour.

# A. Malacca. Presented by W. Griffith, Esq.

This species has very much the aspect of *Iole olivacca*, *Blyth*; indeed, from the close resemblance between them, it might be confounded with that species, but the form of the bill in the two birds will at once distinguish them.

Genus Microscelis, G. R. Gray, List of Gen. of Birds (1840), et Genera of Birds, 1. p. 235.

Pycnonotus ictericus, Blyth, Journ. A. S. Beng. XIV. p. 570.

Turdus indicus, (Gmel.) apud Jerd. Madr. Journ. L. S. X. p. 249.

## A. S. India. Donor unknown.

"This bird frequents only thick and lofty jungle on the west coast, being found occasionally as high as 5,000 feet. It lives in small flocks, flying from tree to tree, and keeping up a continual and

<sup>\*</sup> The stomach is muscular, and of considerable unequal thickness in its outer coat; the inner being tough and striate. Intestinal canal eight inches and a half; the execa very small and rudimentary.

pleasing Bulbul-like warble. In all the specimens I have examined, I have found fruit only in its stomach, but from the strong bristles at the base of the bill, I suppose it may, at certain seasons, partake of insects."—(Jerd., Madr. Journ. L. S. X. p. 249.)

Genus Spizixos, Blyth, Journ. A. S. Beng. XIV. p. 571 (1845).

"General structure of Pycnonotus, but differing greatly in the shortness and (for a member of this group) extraordinary thickness of the bill, the lateral outline of which approaches that of Conostoma amodium, except that the tip of the upper mandible curves more decidedly downward over that of the lower mandible, being also pointed and distinctly notched, with a sinuation corresponding to the notch in the lower mandible; as viewed from above, however, the resemblance to the beak of the Conostoma ceases, for that of the present bird narrows evenly to a point from a tolerably wide base; the ridge of the upper mandible is obtusely angulated, and it is distinctly arched, rising at base where concealed by the feathers of the forehead. Rest as in Pycnonotus, but approaching to Criniger."

# 380. SPIZIXOS CANIFRONS, Blyth.

Spizixos canifrons, Blyth, Journ. A. S. Beng. XIV. p. 571; XX. p. 520; Cat. B. Mus. A. S. Beng. App. p. 13.

A. B. Afghanistan. From Griffith's Collection.

S. canifrons. "Length about 8 inches; of wing 3½; of tail 3½; bill to forehead a little exceeding ½ an inch, and to gape ¾; tarse also ¾ of an inch. General colour bright olive-green, becoming yellowish green and more vivid on the rump and margins of the primaries, and inclining also to yellow on the belly, and more decidedly on the lower tail-coverts; forehead and chin pale ashy; the nape, with the sides and front of the neck, somewhat darker, passing into blackish on the throat; and the crown black, its feathers lengthened to form a crest nearly an inch long; tail-feathers largely tipped with blackish; bill yellow, and legs brown. Habitat, Cherra Poonjee, or the hill-ranges bordering on Sylhet to the northward."—(Blyth.)

Genus Criniger, Temm., Man. d'Orn. (1820). Trichophorus, Temm., Text de Pl. Col. 88 (1838). TRICHAS, Gloger. (1827). ALCURUS, p. Hodgs.

"Exceedingly common at Mussooree in large flocks during the winter and spring; in the latter season, when the *Rhododendron arboreum* is covered with its bunches of deep-crimson flowers, these birds may be seen thrusting their beaks into every flower in search of insects and nectar, and the forehead is in consequence then

generally covered with the pollen and sweets derived from the flowers. It pairs in April, and appears fond of the wild mulberries and other forest berries which then abound in some of the glens. In March, at an elevation of 5,000 feet, I saw them feeding on the wild cherries. They breed during April, May, and June, making a rather neat cup-shaped nest, which is usually placed in the bifurcation of a horizontal branch of some tall tree; the bottom of it is composed of thin dead leaves and dried grasses, and the sides of fine woody stalks of plants, such as those used by Pyenonotus leucogenys, and they are well plastered over externally with spiders' webs; the lining is sometimes of very fine tendrils, at other times of dry grasses, fibrous lichens, and thin shavings of the bark of trees left by the woodcutters. I have one nest, however, which is externally formed of green moss with a few dry stalks; and the spiders' webs, instead of being plastered all over the outside, are merely used to bind the nest to the small branches among which it is placed; the lining is of bark shavings, dry grasses, black fibrous lichens, and a few fine seedstalks of grasses. The diameter of the nest is 23 inches, and 14 inches deep. The eggs are usually three in number, of a rosy or purplish white, sprinkled over rather numerously with deep claret or rufescent purple speeks and spots. In colours, and distribution of spots, there is great variation; sometimes the rufous and sometimes the purple spots prevailing; sometimes the spots are mere specks and freckles; sometimes large, and forming blotches; in some the spots are wide apart; in others they are nearly, and sometimes in places quite confluent: while from one nest the eggs were white, with widely-dispersed dark purple spots and dull indistinct ones appearing under the shell. In all, the spots are more crowded at the larger Diameter varying from  $1 \times \frac{1}{16}$  inches to  $1\frac{1}{16} \times \frac{12}{16}$  inches."— (Capt. Hutton, J. A. S. Beng. XVIII. pt. II. p. 10.)

a. b. c. Nicobars. Presented by the Asiatic Society of Bengal.

H. nicobariensis. "Plumage of a uniform olive-green above, the erown infuscated, or of a brownish-nigrescent hue; throat and breast dingy-whitish, a little tinged with yellow; the rest of the lower parts more deeply and conspicuously tinged with yellow; bill dusky, with yellow tomice, and elsewhere an appearance of its becoming ultimately wholly yellow; the tarsi plumbeous. The nestling tertiaries, and the outer webs of the nestling primaries, are of a dingy chestnut-colour; and there is a shade of the same upon the tail. The same appears to be the case with the young of H. nalaccensis; and the two species considerably resemble at first sight; but the present may readily be distinguished by its infuscated crown and its unstreaked throat and breast."

"Length about  $8\frac{1}{2}$  inches; of wing, from  $3\frac{1}{4}$  to nearly 4 inches; and tail  $3\frac{1}{4}$  inches; bill to gape, 1 inch, in some  $\frac{1}{4}$  more; tarse,  $\frac{3}{4}$  of an inch; the tail is a little graduated, but inclines to assume the true Hypsipetes shape. The bill is rather shorter than H. malaceensis, and the coronal feathers tend less to assume the pointed form."—(Blyth.)

- a. b. 3 9. Bengal. Presented by the Asiatic Society of Bengal.

"This species is spread over a great part of the continent of India, wherever there is a sufficiency of woodland. It is extremely common in all the western provinces, and in the jungles of the Eastern Ghauts, but it is rarely met with in the open country of the Carnatic, Mysore, or Hydrabad, and there only in the vicinity of well-wooded towns. It is usually met with in pairs, flitting about the extreme branches of trees, examining the leaves for various insects, after which it occasionally takes a short flight of a foot or two, or searching for some suitable fruit. It has a somewhat varied note, its usual call being, as Mr. Blyth remarks, not unlike that of the King Crow (Dierurus macrocercus), though softened down and mellowed, and occasionally is very agreeable. I have seen a nest of this species in the possession of S. N. Ward, Esq.; it is a neat but slight cup-shaped nest, composed chiefly of fine grass, and was placed near the extremity of a branch, some of the nearest leaves being, it was said, brought down and loosely surrounding it. It contained two eggs, white, with a few claret-coloured blotches. Its nest and

<sup>\*</sup> This name appears to be a misprint for gampsorhynchus.

eggs, I may remark, show an analogy to that of the Orioles."—(Jerd., Ill. Ind. Orn.)

"This bird is a beautiful songster, and an excellent mocker, and imitates the notes of almost every small bird of the country."—(Tickell, J. A. S. B. 11. p. 578.)

"Extremely common in the south of Ceylon, but rare towards the north. It feeds in small flocks on seeds and insects, and builds an open cup-shaped nest. The eggs, four in number, are white, thickly mottled at the obtuse end with purplish spots."—(Layard, Ann. N. H. (1853), p. 176.)

Black-chinned Yuhin, Hodgs.

a. Nepal. Presented by B. II. Hodgson, Esq.

"These little birds, so far as I have yet ascertained, adhere exclusively to the wild uplands, preferring the lower and more umbrageous to the higher and barer trees, and seem to procure no portion of their food from the ground. They are usually found in small flocks; and have a monotonous feeble monosyllabic note. They feed on viscid stony berries and fruits, and tiny insects that harbour in the cups of large deep flowers, such as the Rhododendrons, and to which the birds cling with their strong feet. Their intestines are about the length of their body (from the tip of the bill to the tip of the tail), furnished with grain-like coeca near the lower end, and of nearly uniform diameter. Their stomach has the muscular coat of very moderate sub-equal thickness, and the lining neither very tough nor much grooved."—(Hodgs., J. A. S. Beng. VI. p. 231.)

"These beautiful little birds are exceedingly common at Mussooree, at an elevation of about 5,000 feet, during summer, but I never saw them much higher. They arrive from the plains about the middle of April, on the 17th of which month I saw a pair commence building in a thick bush of Hybiscus; and on the 27th of the same month the nest contained three small eggs, hard set. I subsequently took a second from a similar bush, and several from the drooping branches of oak-trees, to the twigs of which they were fastened. It is not placed on a branch, but is suspended between two thin twigs, to which it is fastened by floss silk, torn from the coccoons of Bombyx Huttoni, Westw., and by a few slender fibres of the bark of trees, or hair, according to circumstances. So slight and so fragile is the little oval cup, that it is astonishing the mere weight of the parent bird does not bring it to the ground; and yet, within it, three young ones will often safely outride a gale that will bring the weightier nests of Jays and Thrushes to the ground. Of seven nests now before me, four are composed externally of little bits of green moss, cotton, and seed-down, and the silk of the wild mulberry moth torn from the coccoons, with which last material, however, the others appear to be bound together; within, the lining of two is of the long hairs of the Yak's tail (Poëphagus grunniens), two of which died on the estate where these nests were found; and the third is lined with black human hair; the other three are formed of somewhat different materials, two being externally composed of fine grass-stalks, seeddown, and shreds of bark, so fine as to resemble tow; one is lined

with seed-down and black fibrous lichens resembling hair; another is lined with fine grass; and a third with a thick coating of pure white silky seed-down. In all the seven, the materials of the two sides are wound round the twigs, between which they are suspended like a cradle, and the shape is an ovate cup, about the size of half a hen's egg, split longitudinally. The diameter and depth are respectively  $2 \times \frac{3}{4}$ , and  $1\frac{1}{2}$  inches. The eggs usually three in number, of a very pale whitish green; diameter  $\frac{1}{16} \times \frac{6}{16}$  inches. The young continue with the old birds for some time after leaving the nest, and are often mixed up with the flocks of Parus crythrocephalus. They appear to feed greedily upon the small black berries of a species of Rhamnus, common in these localities. They depart for the Doon about the end of October."—(Capt. Hutton, J. A. S. Beng. XVII. pt. II. p. 690.)

"This bird is found in great abundance on the summit of the Neilgherries. Towards the more northern portion of the table-land it begins to occur, though sparingly, in the more wooded parts; and it is of tolerably frequent occurrence among the more wooded valleys of the northern Ghauts. On the Neilgherries, it frequents both the thick woods and gardens, and in the latter may often be seen clinging to the flower-stalks, extracting the minute insects that infest flowers, by the pollen of which its forchead is often powdered. It feeds generally in small flocks, is lively and brisk in its movements, and keeps up a continual feeble twitter."—(Jerd., Madr. Journ. X1. p. 7.)

"Is also common in the southern and midlaud districts of Ceylon, but rare towards the north. It is usually found in small parties, creeping about blossoming trees, examining the flowers where it finds its food. It builds a cup-nest, fixed in the fork of two branches."—(Layard, Ann. Nat. Hist. (1853), p. 267.)

e. Q. Drawing. From Sir T. S. Raffles' Collection.

"This is a bird of social habits, and resorts to the vicinity of human dwellings; indeed, it appears to have retired from the forests, and established itself in the trees and hedges which surround the villages and plantations. The structure of its wings does not enable it to take long-continued excursions, but it shows itself by short and frequent flights between the trees and branches. It is most lively in the middle of the day, when, under a burning sun, the inhabitants uniformly retire to rest; early in the morning, and towards the approach of night, it is rarely perceived; but during the silence prevailing at noon, it enlivens the village with the song of Cheetoo, Chectoo, which it repeats at short intervals during its sportive sallies between the branches. It feeds on small insects, and its economy is in some measure illustrated by the comparative length and sharpness of the bill, and by the broken and splintery state in which the claws are frequently found. The laminæ, or plates which compose them, are separated, and the sides are marked with small fissures, which appear to be occasioned by incessant use in scraping the bark of trees."—(Horsf., Zool. Res. in Java.)

a. b. c. J. Presented by the Asiatic Society of Bengal.

"This is one of the most common birds, and may be seen daily in almost every garden. Its habits are even still more active and restless than those of any other of this family, being much like those of the titmouse. It may be seen diligently and carefully searching the smaller branches and twigs of trees, climbing actively among them, peering under the leaves, and occasionally hanging, like a titmouse, from a slender twig, all the while keeping up a loud warbling strain, or a low querulous sort of note, very different from each other. It is not confined to cultivated ground, but is also an

inhabitant of the open spaces of jungle. Its flight is performed by a succession of quick vibrations of the wing, and causes a loud whining sound. Its food consists of various insects, and their larvæ, spiders, &c. I once, in the West Coast, in the month of September, met with a nest of this species in the fork of a low tree; it was more neatly and carefully made than any other of the few nests I have seen in this country; it contained young ones. It gets its Hindustanee name from its cry, being said to repeat the words, show bheega, show bheega, before rain."—(Jerd., Madr. Journ. X. p. 248.)

"Is extremely abundant in Ceylou, generally found in pairs, creeping about trees. The note is a clear bell-like whistle, which may be imitated on an octave flute."—(Layard, Ann. Nat. Hist. (1853), p. 267.)

PEEBECK, Hind., Jerd.

PAWSEH, Mahrattas, Sylves.

A. B. C. d. & Q., jun. Dukhun. Presented by Colonel Sykes.

e. f. 3, adult et jun. Kumaon. From Captain R. Strachey's Collection.

"This bird, so very common in the Indian peninsula, and which extends up to the N. W. Himalaya, occurs also in the hilly parts of Bengal, as Rajmahl and Monghir, and at Midnapore; but in the vicinity of Calcutta I have never met with it, nor seen specimens in any Collection from the countries eastward."—(Blyth, J. A. S. Beng. XV. p. 49.)

"In the Dukhun, it is very abundant just before the rains. It is a quarrelsome bird."—(Sykes, P. Z. S. (1832), p. 87.)

"In the Carnatic, it is most abundant, I think, during the cold weather, disappearing or nearly so during the hot mouths. This corresponds with the period of their greatest abundance in the Dukhun. It is most numerous in the West Coast, and well-wooded situations; frequents topes, gardens, avenues, and large single trees. It feeds on various fruit, especially the fig of the banian-tree, and also soft-bodied insects. It is not met with in thick forest jungle. Its flight is undulating. It has a loud mellow, plaintive cry, something resembling pee-ho. I once found the nest of this species; it consisted of a cup-shaped nest, slightly made with fine grass and roots, and suspended from a rather high branch by a few long fibres of the same material apparently as the nest itself; these did not surround the nest, but only supported it on two sides. It contained three eggs, white, spotted chiefly at the larger end with large purplish blotches."—(Jerd., Ill. Ind. Orn.)

"This most lovely-plumaged bird is far from being uncommon in many of the lofty forest jungles of Malabar; I have seen it in the jungles near Palghautcherry, Trichoor, the Wynaad, and on the Coonoor Ghaut, as high as 4,000 feet, and upwards. It is only found in the densest portions of the jungle. It lives generally in small parties of four or five, or more, occasionally in pairs; frequents the loftiest trees near their summits, and feeds on various fruits and berries. It has a loud, mellow, agreeable warble, which it is frequently heard repeating, by which I have generally first detected their presence in the thick and umbrageous parts of the forest they inhabit."—(Jerd., Madr. Journ. X. p. 262.)

#### 421. IRENA MALAYENSIS, Moore.

Irena puella of the Malay countries, Auctorum. (Horsf., Zool. Res. in Java, t. J. Q. Temm., Pl. Col. 70, 225, 476. Bonap., C. G. Av. p. 349.)

A. B. c. & Q. Java. From Dr. Horsfield's Collection.

D. J, and Drawing. Sumatra. From Raffles's Collection.

e.f. Q. Malacca. Purchased.

The distinction between the Indian and Malayan Irena was first pointed out by Lord Arthur Hay, to the former of which he gave the name of I. indica; but as the specimen described by Latham was from India, the name puella will apply to those from the Continent only; consequently, the Malayan is without a name, for which species Malayensis is applied. "In the Malayan bird, the under tail-coverts reach quite to the end of the tail; while in I. puella, Lath., they are never less than an inch and a quarter short of the tail-tip in the males, and generally an inch and a half short in the females. I have verified this observation upon so many examples, from both regions, that there can be no doubt of the fact."—(Blyth, J. A. S. Beng. XV. p. 308.)

"This species inhabits woods and forests, feeding on fruits and wild grains. In Java it is a very rare bird, and confined to a few districts, where it conceals itself on solitary hills, distant from the habitations of man, preferring rather elevated and cool situations. I met with it only in the western parts of the island; once in the province of Banyu-mas, and a second time on the ridges of hills situated southwest from Buitenzorg. This bird is also found in the interior of Sumatra and the adjacent islands."—(Horsf., Zool. Res. in Java.)

f. Drawing. Siam. Finlayson.

g. & Q. Drawing. Dr. F. (B.) Hamilton's Collection.

"The Dayal is generally spread throughout India, and frequents jungles, gardens, avenues, topes, &c. It is solitary; frequenting thick trees and bushes; feeds on the ground, flying down from a low branch, its usual perch, and frequently hopping a few steps on the ground, jerking its tail well up every now and then. On securing an insect, it flies back to its perch, elevating its tail on re-seating itself, and uttering a pleasant warble. Towards evening, it may often be seen near the top of some lofty tree in the jungle, pouring forth its agreeable song, which, however beautiful, must yield the palm to the Shama (Kittacincla macroura)."—(Jerd., Madr. Journ. X. p. 263.)

"Arrives on the hills, up to 5,000 feet, in the beginning of April. It returns to the Doon and the plains in early autumn. It breeds in May, on the 19th of which month I took a nest from a bank by the roadside; it was composed of green mosses, and lined with very fine roots. Eggs four, carneous cream-colour, somewhat blistered at the larger end; diameter,  $\frac{1}{16} \times \frac{8}{16}$  ins. Delights to sit on the topmost branches of a tree, generally selecting a dry and leafless twig, from whence it utters a pleasing song, which is replied to by another individual at no great distance. When on the ground, it hops with the wings half open or drooping, and at each hop it stops to spread and jerk its tail."—(Hutton, J. A. S. Beng. XVII. pt. 2, p. 686.)

"The Dayals, if found in the wilds, tenant meadows and grassland, provided with brushwood; but they are nowhere so common as in gardens and on lawns, which they enliven in spring by their song, and, at all times, by their vivacity and familiarity. They dislike and avoid the interior of woods. Their usual food is grubs, worms, beetles, grasshoppers, and their congeners; rarely, in winter, they take unripe vetches, and such like, but never gravel, sand, or hard seeds. They move quickly on the ground, yet perch firmly and readily, frequently watching for their prey on a low twig, to which they return as soon as they have beaten it to death on the ground. They never seize on the wing. When cattle pass their way, they will partially attend on the herd, descending occasionally from their perch to snap up the insects and grubs brought to light by the act of grazing. These birds are perpetually in motion, and raise and depress the body with flirtation of the tail, exactly in the Wagtail Their habits of society, in respect to their own kind, are solitary, or nearly so, except in the breeding season, when these monogamous and attached birds steadily unite to rear and defend their young. The female usually lays five spotted eggs, bringing up from

three to four young ones, and but once a year, unless the first brood has failed or been rifled from her. The nest is carelessly made of grass, but is always placed in a secure and sheltered position,-commonly a hole in a wall, sometimes the interior of a low, thick, prickly plant. The Dayal is one of the boldest and most docile of birds, ; and is perpetually eaged both for his song and his pugnacity. of the Thrushes have a finer note, nor is it degraded by apish tricks of imitation, though this intelligent bird will lend its courage for the profit or amusement of its keeper. In the spring, the male birds are perpetually challenging each other, and no sooner is the defiance of one uttered than it is answered by another. The professional bird keeper, availing himself of this propensity, takes out his tame male on his fist, and proceeds to the nearest garden or grove; the bird, at his bidding, presently challenges; the wild one immediately answers; the former is then slipped, and a desperate contest ensues between the two, during which the fowler readily secures the wild bird, with the tame one's assistance; for the latter will deliberately aid his owner's purpose, seizing the wild bird at the critical moment with both claws and bill, and retaining it till his master comes up, in case it has not been so much exhausted by the previous contest as to be disabled from flying away upon the man's approach. Fighting the tame birds is a favourite amusement of the rich, nor can any race of game-cocks contend with more energy and resolution than do these birds."--(Hodgs., As. Res. XIX. p. 186.)

"This bird is used by the Mussulmen when invoking the name of God."—(Dr. F. (B.) Hamilton's MS.)

"In Ceylon, this familiar bird is called the 'Magpie Robin' by Europeans, and the natives regard it with as much interest as we do our own red-breasted favourite, of which it is the Eastern representative. It is seldom seen away from habitations, about which it usually builds, though the nest is often placed in a thick bush or hollow tree. The eggs, commonly four in number, are bright blue, thickly spotted with brown at the obtuse end. The food is insects of all kinds and in all stages, captured on the ground and on trees. They have a variety of notes, and the song poured out in the fulness of their joy in the pairing season is very pleasing. On the top of a towering cotton-tree, opposite my residence in Colombo (in Ceylon), a Magpie Robin daily for some weeks charmed me with his song, whilst his mate sat brooding her eggs or callow nestlings in the roof of a native but beneath him. One morning, after the young had left the nest and betaken themselves to the

neighbouring compounds, I was attracted by cries of distress from various birds and squirrels, and, above all, I heard the seemingly plaintive mewing of a cat; I had no living specimen of the last in my Museum, so, wondering what could be the matter, went into my garden to see. I found the mewing proceeded from my friends the Robins, who were furiously attacking something in a bush, whilst the birds and squirrels screamed in concert. There I found one of the young Robins (whose plumage, by the way, at that early age, much resembles that of the European bird, being speckled with yellow), caught, as I thought, in the tendrils of a creeper; I put out my hand to release it, when, to my surprise, I saw the glittering eyes of the green whip-snake (Trimesurus viridis, Lacep.), in whose fangs the bird was struggling. I seized the reptile by the neck and rescued the bird, but too late; it lay panting in my hand for a few moments, then fluttered and died. On skinning it, I found no wound, except on the outer joint of the wing by which it had been seized, and am confident that fear alone deprived it of life. favourite attitude of this bird is standing with the tail elevated over the back, either perpendicularly, or thrown so much forward as to nearly touch the head, the wings drooping; in this position, they only utter a low note. During the dry season, some of our birds become so discoloured with the dust of our red kabook soil, that they are useless as specimens for preserving."—(Layard, Ann. Nat. Hist. (1853), p. 263.)

"The Shama seems to be common in the hill jungles of Central India, and those at the foot of the Himalaya, and it is especially numerous in the territories eastward of the Bay of Bengal, and in

the Malay countries generally; but in the south of India it is somewhat rare."—(Blyth, J. A. S. Beng. XIV. p. 139.)

"Is only found in the most retired and impervious parts of the thickest forest jungle. It is solitary; perches on low branches, and hops to the ground to secure a grasshopper, or other soft insect. When alarmed, it flies before you from tree to tree at a low height. Its song is heard in the greatest perfection towards evening, and is surpassed by no Indian bird, if indeed it is by the celebrated Nightingale."—(Jerd., Madr. Journ. X. p. 264.)

"The Shama is reputed to be the finest of Oriental songsters; besides which, it has a considerable propensity to imitation, and one in my own possession learned to give the crow of a cock to perfection, also the notes of the Coël (Eudynamis orientalis), the chatter of a troop of Saat Bhyes (Malacocircus canorus), &c. Many thousands of these elegant birds are kept in cages in Calcutta, and the universally absurd practice is to darken their cages by wrapping them with several folds of cloth, enough to stifle the luckless captives in this climate, though it must be confessed they sing most vigorously while thus circumstanced, but certainly not more so than mine which were exposed to the light and air. It is a practice of the rich natives to employ servants to carry about their Shámás and other birds, and the number which are thus borne about the streets of Calcutta is astonishing; the poor birds are shut out from all light and air, like Mahomedan ladies enjoying (!) their evening drive, but they nevertheless (i. e. the birds) sing forth most lustily and melodiously."—(Blyth, Ann. Nat. Hist. XII. p. 98.)

"In the mornings and evenings the notes are heard through the valleys, ceasing with twilight. The strains sweep with a gush of sweetness through the enchanting solitudes which this bird makes its favourite resort, at times when other birds are silent in rest; and in unison with the surrounding scenery, in which nature seems to have lavished every fantastic invention of beauty, the effect produced on the mind and ear can alone be appreciated by those who have witnessed the magnificence of a tropical forest."—(Tickell, J. A. S. Beng. II. p. 575.)

A. B. & Q. Dukhun. Presented by Colonel Sykes.

"This well-known bird is tolerably common in southern India, and its familiar habits have gained for it the name of 'Indian Robin.' It is found mostly about villages, pagodas, walls, old buildings and houses, often perching on the roof or pandaul, and feeding in the verandas, or occasionally even entering houses. is generally seen singly or in pairs; feeds on the ground, on which it runs with great agility, frequently pursuing and capturing several insects before it reseats itself on its perch, either on a house, or some neighbouring tree or bush. At all times, but especially when feeding, it has the habit of jerking up its tail by successive efforts. so as almost to overshadow its head. The male has a very sweet little song, which it warbles forth from the top of a wall or low tree; and it is occasionally eaged. It is not confined to the vicinity of villages, &c.; but it is very common on stony hills, and in various other situations. I have twice seen the nest of this bird; once, built among a heap of large stones raised from a boury, and the bird made its nest during the time the well was being blasted, and continued the process of incubation till the young ones were hatched, when it was accidentally destroyed. On the other oceasion, it had built its nest in a hole inside the wall of a house; it contained four eggs, light dusky bluish colour, spotted with purplish brown."-(Jerd., Madr. Journ. X. p. 261.)

"In Ceylon, this bird is a household favourite, frequenting equally the governor's palace and the native hut. It is never seen in the unfrequented jungle, but, like the cocoanut-tree, which the Cingalese assert will only flourish within the sound of the human voice, is found about the habitation of man. It feeds on insects of all kinds, and, like its congener the Magpie Robin, sits upon house-tops or fences, with its tail elevated, and utters a pleasing song. I have

procured their nests, which are composed of hair, mosses, and dry grasses, in the months of June and July in Colombo, in December and April in the north. The eggs are from three to five in number."—(Layard, Ann. Nat. Hist. (1853), p. 267.)

B. c. d. 3 9. Nepal. Presented by B. H. Hodgson, Esq. e. J. Drawing. From Dr. F. (B.) Hamilton's Collection.

"Inhabits all northern India, visiting the plains during the cold season, when it is not rare in the vicinity of Calcutta. On the castern side of the Bay of Bengal, it extends southward to the Tenasserim provinces."—(Blyth, J. A. S. Beng. XVI. p. 128.)

"Arrives in the neighbourhood of Mussooree in April, and breeds in June, on the 13th of which month I took a nest from a hole in a bank by the roadside in a retired and unfrequented situation; I afterwards found another nest in a hole of a rock, also in a retired spot. The elevation was about 5,000 feet. Externally the nest is composed of green moss, and lined with black fibrous lichens like hair. The eggs are four in number, of a dull and pale olive-green, faintly or indistinctly clouded with dull rufous or clay colour. Diameter,  $\frac{1}{16} \times \frac{1}{16}$  in. The male has a very pleasing song, which he warbles forth from the midst of some thick bush, seldom exposing itself to view, like Stoparola melanops, which delights to pereh upon some high exposed twig."—(Hutton, J. A. S. Beng. XVII. pt. 2, p. 687.)

## 447. CYORNIS BANYUMAS, Horsf. Sp.

The Indigo Flycatcher, Lath.

NIL-NILAN, Java, Horsf.

A. b. J. Java. From Dr. Horsfield's Collection.

"This bird lives solitarily on the most elevated mountain-peaks of Java. It is very rarely observed. Its retired habits lead it into the thickest forests, where the uniformity of its plumage tends most effectually to conceal it. During one of my excursions on Mount Prahu, I discovered a few individuals perched on the branches of a tree extending across the road. I also observed it on the declivities of the mountain Merbaboo. It emits a feeble plaintive sound in short frequently-repeated notes."—(Horsf. Zool. Res.)

## A. B. & Q. Madras. From Wight's Collection.

"This species is found on the Neilgherries, in the dense woods of which it is far from being uncommon. It captures insects of various kinds on the wing, from a fixed perch; occasionally a small flock of five or six of them are seen together in a state of continual movement, taking short darts and gambols in the air, as much in sport apparently as in actual pursuit of insects. I discovered its nest twice, built in a slight hole on a steep earthen bank on a roadside, but did not procure the eggs, both birds having forsaken their nests."—(Jerd., Madr. Journ. XI. p. 16.)

## 451. HYPOTHYMIS MELANOPS, Vigors Sp.

Muscicapa melanops, Vigors, P. Z. S. (1831), p. 171. Gould, Cent. of Birds, t. 6. Sykes, P. Z. S. (1832), p. 85. Jerd., Madr. Journ. XI. p. 15.

Muscicapa sapphira, G. R. Gray, Gen. of Birds, I. p. 263.

The Sapphire-headed Flycatcher, Jerd.

No. 945 ♂, 974 ♀, Hodgs., Catal.

A. B. C. & (adult et jun.), D. E. Q. Nepal. Presented by B. H. Hodgson, Esq., September, 1853.

The following is the size of our specimens of this beautiful bird: male, length 4 in., of wing  $2\frac{4}{12}$  in., of tail,  $1\frac{3}{4}$  in., bill to forehead  $\frac{3}{10}$  in., from gape  $\frac{1}{2}$  in., tarse  $\frac{1}{2}$  in. middle claw  $\frac{7}{12}$  in., hind claw  $\frac{3}{12}$  in. "Colour of the upper parts rich dark purplish-blue, inclining to ultramarine on the rump and upper tail-coverts; forehead and crown vivid smalt blue; the lores black; fore-neck and breast rich purple, with a broad median line of deep and bright ferruginous; flanks greyish; the belly and fore part of the wings underneath, with the axillaries, white; alars and tail black edged with blue externally. Bill and feet black."—(Blyth.\*)

The young male has the forehead, crown, and back, black, with the centre of each feather ferruginous, as are also those on the forepart of the wing and the tip of the secondaries; wings and tail black edged with blue externally; throat ferruginous, paling on the breast, where the feathers are margined apically with black; belly and under tail-coverts bluish white.

"In the female of this species, the wings, tail, and rump are of the same beautiful deep blue as in the male, but the head, neck, and interscapularies are plain brown; throat and fore-neck (and breast) ferruginous, rather paler and much broader than in the male; the belly and lower tail-coverts the same bluish white as in the male; axillaries and fore part of the wing underneath also pure white."—(Blyth, J. A. S. XVI. p. 473.)

The ferruginous colour of the throat, fore-neck, and breast in our

<sup>\*</sup> Mr. Blyth gives the following as the dimensions of this bird: "Length 5 inches, of wing 2½, and tail 1½ inch; bill to gape ½ inch, and tarse § inch."

specimens of the female (as here described by Mr. Blyth) is much deeper and brighter than in the males.

"This bird is common in the central and northern regions of Nepal; is a forester, and shy. Feeds on insects, soft and hard, and on pulpy berries."—(Hodgs., P. Z. S. (1845), p. 27.)

## 465. NEMURA HYPERYTHRA, Blyth Sp.

Ianthia hyperythra, Blyth, J. A. S. Beng. XVI. p. 132; Cat. B. Mus. A. S. Beng. p. 170.

Nemura hyperythra, G. R. Gray, Gen. of Birds, UI. App. p. 8. Bonap., C. G. Av. p. 300.

A. B. &. Nepal.\* Presented by B. H. Hodgson, Esq. September, 1853.

<sup>\*</sup> This species, forming part of Mr. Hodgson's late present to the Company's Museum, is marked, by mistake, with the same number, viz. 140, which had previously been applied to Niltava sundara. See Gray's Zool. Misc.

N. hyperythra. "Length about 5 in., of wing  $3\frac{1}{5}$  in., tail  $2\frac{1}{4}$  in., bill to front  $\frac{4}{12}$  in., from gape  $\frac{1}{12}$  in., and tarse 1 in. Upper parts of male deep indigo-blue, brightening to ultramarine on the forchead and above the eyes, and upon the shoulders of the wing; the wings and tail black, margined with blue externally; lower parts bright yellowish ferruginous, confined to a narrowish streak on the middle of the throat and foreneck; lower tail-coverts and centre of belly white. Female, a rich brown above, approaching to the colour of Erytheca rubecula; or rather, the feathers are merely tipped with this colour, showing more or less of the cincreous dusky tint within; tail blue, as in the male; the rump a lighter and more greyish blue; there is also a little blue on the shoulder of the wing, and a greyish blue supercilium, brightening posteriorly; lower parts tawny brown or subdued fulvous, except the lower tail-coverts, which are white: bill and legs dusky in both sexes."—(Blyth.)

# 466. NEMURA HODGSONI, Moore.

Nemura Hodgsoni, Moore, P. Z. S. (1845), p.

A. B. c. d. of 9. Nepal (No. 949, Hodgs. Cat.). Presented by B. H. Hodgson, Esq., September, 1853.

N. Hodgsoni. Length  $3\frac{a}{8}$  in., of wing  $3\frac{a}{8}$  in., tail  $1\frac{1}{4}$  in., bill to front  $\frac{a}{8}$  in., to gape  $\frac{a}{16}$  in., and tarse  $\frac{1}{2}$  in. Male, colour of the upper parts purplish blue, brightening to vivid ultramarine on the crown; forehead, lores, and sides of head, wings and tail black, the two latter margined with blue externally; on the rump some of the feathers are tipped with white; upper tail-coverts blue; lower parts yellowish ferruginous; under wing-coverts, flanks, and under tail-coverts white. Female, ferruginous brown, richer on the rump; wings and tail dusky, margined with ferruginous brown externally; lores, ear-coverts, and under parts pale dusky ferruginous; under tail-coverts white: bill black, legs pale horn.

## Subfam. II. PHILOMELINA, Swains.

Genus Ruticilla (Ray), Brehm., Deutschl. Væg. (1828). Ficedula, Boie, Isis (1826).

PHENICURA, Swains., Faun. Bor. Amer. p. 489 (1831). Chemarrhornis,\* Hodgs. Gray's Zool. Misc. (1844), p. 82.

# 468. RUTICILLA PHŒNICUROÏDES, Moore.

Ruticilla phœnicuroïdes, *Moore*, *P. Z. S.* (1854), *p. . t.* Sylvia atrata, var. A., *Lath.*, *Hist.* VII. *p.* 27.

a. b. J. Shikarpore. From Griffith's Collection.

R. phænicuroïdes. Length 5 in., of wing 3 in., tail  $2\frac{1}{2}$  in., bill to gape  $\frac{1}{16}$  in., tarse  $\frac{6}{8}$  in.; forehead, lores, ear-coverts, throat, and breast black; erown, neck, back, and upper wing-coverts ash, with a rufous tint, the ash palest on the crown; wings brown, with the edges of the exterior webs paler; from breast to vent, under wing-coverts, rump, upper and lower tail-coverts, and tail (except the two middle feathers, which are brown), rufous red.

In this species the black colour of the breast extends much lower down, and the first primary is a  $\frac{1}{4}$  in, longer, the second being shorter by a  $\frac{1}{4}$  in., than in R. Phanicura; the bill is more elongated, and a trifle longer, and not so broad at the base. It is closely allied to R. Phanicura, but is readily distinguished from it by the absence of white on the crown.

A. J. Dukhun. Presented by Colonel Sykes.

B. J. Afghanistan. From Griffith's Collection.

c. d. 3 9. Nepal. Presented by B. H. Hodgson, Esq.

R. nipalensis. Male, length 6 in., of wing  $3\frac{1}{2}$  in., tail  $2\frac{3}{4}$  in., bill to gape  $\frac{1}{16}$  in., tarse  $\frac{6}{8}$  in. Crown ashy grey; lores, ear-coverts, neck, throat, breast, back, and upper wing-coverts, black with greyish edges to the feathers; wings brown; primaries and secondaries margined with pale rufous; under wing-coverts, flanks, belly, rump, upper and lower tail-coverts, and tail (except one half of the interior and a small portion of exterior web of the two middle feathers near the tip, brown), rufous red. Female, above, brown; margins of the wings, abdomen, and under tail-coverts pale rufous; below, dusky on the throat and breast, changing to clear light rufous on the abdomen

and under tail-coverts; rump and tail the same as in the male; bill and legs black.

"This species is very common in most parts of India during the cold weather, but more so in the table-land, I think, than in the Carnatic. It is solitary, frequenting wooded places, gardens, hedges, old walls, and outbuildings; being often seen about the roofs of houses. Feeds on the ground, on wasps, ants, and various other insects. Has a most peculiar quivering motion of its tail, especially after feeding."—(Jerd., Madr. J. X. p. 267.)

"Has a peculiar manner of vibrating its tail, when seated on a bough. A pair of these birds built their nest in an outhouse constantly frequented by my servants, and within reach of the hand."—(Sykes, P. Z. S. (1832), p. 92.)

## 471. RUTICILLA HODGSONI, Moore.

Hodgson's Ruticilla.

THARCAPNI, Nepal, Hodgs.

A. J. Bootan. From Pemberton's Collection.

b. c. d. e. 3 9. Nepal. Presented by B. H. Hodgson, Esq.

R. Hodgsoni. Male, length 6 in., of wing 3\squares in., tail 2\squares in., bill to gape \squares in., and tarse \squares in.; forchead, lores, ear-coverts, throat, and breast black; fore part of crown clear white (much narrower than in R. Phænicura); hind part of crown, neck, back, and upper wing-coverts fine ash, lightest on the crown; wings dusky brown, the exterior margin of the basal half of the secondaries white, forming a patch; from the breast to vent, under wing-coverts, rump, upper and lower tail-coverts, and tail (except the interior and exterior margins only of the two middle feathers, which are dusky brown), rufous red.

The female may be readily distinguished by a general puffy appearance, and by the relative length of wing, &c.

472. RUTICILLA ERYTHROGASTRA, Güldenstadt Sp.

Motacilla crythrogastra, Guldst., Nov. Comm. Petrop. XIX. p. 469, t. 16, 17. Gmel., S. N. L. I. p. 975.

Ruticilla aurorea, apud G. R. Gray, Gen. of Birds, I. p. 180.

The Chestnut-bellied Warbler, Lath.

- A. b. J. Kumaon. From Captain R. Strachey's Collection.
- B. J. Nepal (No. 969, Hodgs. Cat.). Presented byB. H. Hodgson, Esq., September, 1853.
- C. 3. Cashmere. Presented by John Gould, Esq., December, 1853.

R. erythrogastra. Male, length 7 in., of wing 4 in., and tail 3 in., bill to gape  $\frac{n}{8}$  in., tarse 1 in.; forehead, lores, ear-coverts, throat, fore part of breast, back, wing-coverts, and the apical portion of the primaries and secondaries black; crown of the head, back of neck, and the basal portion of the primaries and secondaries white; breast, belly, vent, rump, upper and lower tail-coverts, and tail rich rufous; bill and legs black. The female is unknown.

This is the rarest of all the known species of Redstarts.

M. Güldenstadt informs us "that it frequents the gravelly hollows of the Caucasian torrents during the whole of the summer, and migrates southward in search of food on the approach of winter; and that it runs along the banks of rivers; is restless, but not fearful; often moves its tail while sitting on the low shrubs, and makes its nest among the branches of the sea buckthorn, of the berries of which it is very fond."

# 473. RUTICILLA VIGORSI, Moore.

Ruticilla Vigorsi, Moore, P. Z. S. (1854), p. . . t.

- A. 9. Bootan. From Pemberton's Collection.
- R. Vigorsi. Female, length 7 in., of wing 44 in., tail 3 in., bill to

gape  $\frac{n}{5}$  in., and tarse 1 in.; above, head, neck, and back, einercous; wings dusky, with paler margins; beneath, rufescent; upper tail-coverts and tail rufous; the two medial feathers dusky, as is also the exterior web of the outer and tip of each feather, but paler; bill and legs black. No trace of white on the wings. First quill  $1\frac{1}{2}$  in. shorter than the second, the third  $4\frac{1}{2}$  in. longer than the second; fourth and fifth equal and longest; third and sixth equal, and but a trifle shorter than the two last; the seventh  $a\frac{1}{4}$  in. longer than the second; the eighth  $\frac{1}{8}$  in. shorter than the second.

The male of this species may eventually prove to be allied to **R.** erythrogastra, but differing from it in the absence of the white wing-patch.

## 474. RUTICILLA AUROREA, Pallas Sp.

Motacilla aurorea, Pall., Zoogr. I. p. 477. Kittl., Kupf. Væg. t. 26, f. 1. Gmel., S. N. L. I. p. 976. Lath., Hist. VII. p. 92.

- C. J. Japan. Presented by John Gould, Esq., Dec. 1853.

R. aurorea. Male, length 5 in., of wing 3 in., tail  $2\frac{1}{2}$  in., bill to gape  $\frac{\pi}{8}$  in., and tarse  $\frac{3}{4}$  in. Forehead, lores, ear-coverts, throat, fore part of breast, back, upper wing-coverts, apical and basal portion of the secondaries and tertiaries, and the two medial tail-feathers, black; exterior margin of the outer tail-feather and apical margin of the rest, dusky black; medial portion of both webs of the secondaries and tertiaries white; erown of head and back of neck slaty ash, rather whitish above the ear-coverts; breast, abdomen, under wing-coverts, upper and lower tail-coverts, and tail (except as above), rufous. Female, brown above; the wing-patch rufescent white, beneath rufescent; upper and lower tail-coverts and tail (except the medial feathers of the latter, which are dusky brown) rufous; bill and legs black.

#### 475. RUTICILLA RUFOGULARIS, Moore.

Rutieilla rufogularis, Moore, P. Z. S. (1854), p. t.

A. B. C. & Q. Pushut. From Griffith's Collection.

R. rufogularis. Male, length 5½ in., of wing 3½ in., tail 2½ in., bill to gape ½ in., and tarse ½ in. Crown and back of neck mixed grey and ash; lores, ear-coverts, and sides of neck, black; wings and medial tail-feathers dark brown; apical margin of the exterior web of the outer tail-feather dusky; smaller wing-coverts (except the feathers immediately on the shoulder), scapulars, basal portion of the speculars, and apical margins of the greater wing-coverts, white; exterior margin of the primaries and secondaries pale rufescent; throat and breast, back and rump, upper tail-coverts, and tail, rufous; abdomen, under wing and tail-coverts, pale rufescent; bill and legs black. Female, cincrous brown above, rufescent beneath; wings dark brown, the feathers of which are margined with pale rufescent; lower part of back, upper tail-coverts, and tail, rufous, the two medial feathers dark brown, exterior margin of the outer dusky.

secondaries and tertiaries, extending over both webs of each feather; bill and feet black: according to season, the dorsal plumage is margined with brown edgings, the under parts more slightly with greyish, and the wing-coverts with brown. Length about 6 inches, of wing  $2\frac{3}{4}$  inches, and tail  $2\frac{3}{8}$  inches, bill to gape  $\frac{9}{8}$  inch, and tarse  $\frac{3}{4}$  inch. Female, plain brown above, paler beneath, with rufous tail, and the same great white wing-patch as in the male."—(Blyth.)

## 476. RUTICILLA CÆRULEOCEPHALA, Vigors Sp.

Phoenicura caruleocephala, Vigors, P. Z. S. (1830), p. 35. Gould, Cent. of Birds, t. 25, f. 2. Blyth, J. A. S. Beng. XI. p. 190.

Ruticilla cœruleocephala, G. R. Gray, Gen. of Birds, I. p. 180. Hodgs., Cat. B. of Nep. p. 68. Blyth, J. A. S. Beng. XVI. p. 134; Cat. B. Mus. A. S. Beng. p. 168. Bonap., C. G. Av. p. 296. Moore, P. Z. S. (1854), p.

- a. b. J. Bootan. From Pemberton's Collection.
- c. J. Pushut. From Griffith's Collection.

R. cæruleocephala. Male, length  $5\frac{\pi}{4}$  in., of wing  $3\frac{1}{4}$  in., tail  $2\frac{\pi}{4}$  in., bill to gape  $\frac{\pi}{8}$  in., and tarse  $\frac{\pi}{8}$  in. Top of the head slaty ash; lores, ear-coverts, throat, breast, back, rump, upper tail-coverts, and tail, black; wings dark brown; the scapulars and outer edges of the secondaries white; the under wing-coverts, belly, and vent, whitish; bill and legs black. Female unknown.

## 477. RUTICILLA NIGROGULARIS, Hodgson.

Ruticilla nigrogularis, Hodgs. Moore, P. Z. S. (1851), p. t.

A. B. J. Nepal. Presented by B. H. Hodgson, Esq., September, 1853.

R. nigrogularis. Length 6 in., of wing 3\frac{3}{8} in., tail 2\frac{6}{8} in., bill to gape \frac{1}{16} in., tarse \frac{5}{8} in. Crown of head slaty blue, lightest on the forehead; lores, ear-coverts, throat, back of neck, back, upper wing-coverts, two middle tail-feathers entirely, and the rest (except the basal portion), black; wings blackish brown, the scapulars, outer edges of the secondaries, and under wing-coverts white; breast, flanks, belly, rump, upper and lower tail-coverts, and base of tail (except the two middle feathers), bright chestnut; vent and under tail-coverts mixed with white; bill and legs black.

This species is allied to R. schisticeps (the description of which is annexed), but differs in having the throat black instead of white.

## RUTICILLA SCHISTICEPS, Hodgson.

## a. b. 3. Nepal. Presented by B. H. Hodgson, Esq.

"This bird is common to all the three regions of Nepal, and never quits the woods. It perches freely, but is usually on the ground. Its stomach is feebler than in *Tesia*, and does not take seeds or gravel. From the number of insect nests and larvæ found in its stomach, I have called the genus *Larvivora*."—(Hodgs., J. A. S. Beng. VI. p. 103.)

"Is rare in the Neilgherries; also very rare and accidental in Lower Bengal during the season of passage."—(Blyth.)

"I observed this bird very rarely in thick and tangled underwood on the Neilgherries. It has a single low chuckling note, like that of some of the Stonechats."—(Jerdon.)

e. J. Drawing. From Dr. F. (B.) Hamilton's Collection.

"The Bluebreast affects the open country, where there are no trees, and especially reedy places or plantations of sugar-cane, or growing corn or high grass, or ground covered with the broad leaves of cucurbitaceous plants; and there they are seen generally on the ground, running with alternate steps, like a Pipit or Wagtail, and occasionally spreading wide the tail, displaying its rufous base to advantage; seldom perching, but flitting before you as you advance, and disappearing among the low cover, but soon coming forth when all is still, yet without absolutely quitting the shelter of the herbage by going more than a few paces from it. In Lower Bengal these birds are extremely common in suitable situations."—(Blyth, J. A. S. Beng. XVI. p. 135.)

"In the Dukhun, this is far from being common, and is only found during the cold season, from October till March. It frequents thick hedges, gardens, sugar-cane fields, and long grass or weeds in beds of tanks, &c., occasionally coming close to houses; and feeds on the ground, on which it runs along picking up various insects, and does not return so quickly to its perch, neither has it that peculiar quivering of the tail, as the Indian Redstart, though while feeding on the ground it occasionally jerks it up. It generally, when observed, tries to conceal itself among the bushes it frequents."—(Jerd., Madr. Journ. X. p. 267.)

Mr. E. L. Layard "procured this bird in Ceylon, at Ambegamoa, in

the month of March. Was not seen in any other locality."—(Ann. N. H. (1853), p. 267.)

Orthotomus flavoviridis, *Moore*, *P. Z. S.* (1854), *p.* The Yellowish-green Tailor-Bird.

A. B. Malacca, Purchased.

O. flavoviridis. The forehead, crown, round the eyes, and occiput,

ferruginous; back and rump yellowish green; tail more dusky green; wings brown, broadly margined exteriorly throughout with yellowish green; chin, base of lower mandible, ear-coverts, centre of some of the feathers of the throat and breast, white; throat and fore part of breast black, centered as above; lower part of breast ash and white; middle of the abdomen white; flanks yellowish; extreme edge of shoulder of wing yellow; under part of tail yellowish, with a terminal dusky band, tipped with yellowish; thighs greenish-ferruginous. Specimen labelled male. Length 4 in., of wing  $1\frac{\pi}{4}$  in., tail  $1\frac{\pi}{4}$  in., tarsus  $\frac{\pi}{10}$  in.; bill to gape  $\frac{\pi}{10}$  in.

## 490. ORTHOTOMUS CINERACEUS, Blyth.

Orthotomus eineraceus, Blyth, J. A. S. Beng. XIV. p. 589 (1845); Cat. B. Mus. A. S. Beng. p. 144. Bonap., C. G. Av. p. 282. Moore, P. Z. S. (1854), p. Orthotomus sepium, apud Lafr., Mag. de Zool. t. 51. The Grey Tailor-Bird.

A. Malacca. Purchased.

"Upper parts pure ash-grey, without any tinge of green; forehead

The following are the descriptions of the other known species of this genus.

## ORTHOTOMUS LONGIROSTRIS, Swains.

Orthotomus longirostris, Swains., 2\(\frac{1}{4}\) Cent. p. 343 (1837). G. R. Gray,
 Gen. of Birds, I. p. 162. Bonap., C. G. Av. p. 282. Moore, P.
 Z. S. (1854), p.

The Black-throated Grey Tailor-bird.

## HAB. S. W. Australia, Swains. Malacca?

"Cincreous; sides of the body beneath cincreous, the middle white; head, chin, and thighs, ferruginous; throat black; tail brownish, graduated; the latter with dusky black ends, tipped with whitish. Bill and legs pale.

"Length  $4\frac{1}{4}$  in.; bill to gape  $\frac{2}{10}$  in.; wing  $2\frac{1}{10}$  in; tail beyond 1 in.; base  $1\frac{4}{10}$  in.; tarsus  $\frac{2}{10}$  in."—(Swainson.)

This species differs from O. cineraccus, B., in having a black throat, and the wing being  $\frac{1}{10}$  in. longer; the tarsus also being longer by a  $\frac{1}{4}$  in.

# ORTHOTOMUS CUCULLATUS, Temm.

Orthotomus cucullatus, Temm., Pl. Col. 599, f. 3. G. R. Gray, Gen. of Birds, I. p. 162. Bonap., C. G. Av. p. 282. Moore, P. Z. S. (1854), p.

HAB. Java, Sumatra, Temminck.

"Top of head bright ferruginous; neck, jaws, and the sides of the breast of a pure ash; the neck in front, the breast, and the middle of the belly, are pure

and sides of the head light ferruginous, palest on the cheeks, and there is a slight tinge of the same upon the chin; crown tinged with olive brown; lower parts white, passing to light ashy on the sides of the breast; tail somewhat brownish, with terminal dusky band, and whitish extreme tips to its outer feathers; tibial plumes rust-coloured; the tarsi and toes red brown; bill dusky above, pale beneath. Length about  $4\frac{1}{2}$  in., of wing  $1\frac{8}{10}$  in., tail  $1\frac{5}{8}$  in., bill to gape  $\frac{5}{4}$  in., tarse  $\frac{5}{8}$  in."—(Blyth.)

In our specimen of O. cineraccus, the centre of the throat, and the whole of the breast and flanks are lightish ash, paling to silky white on the centre of the belly; the chin and sides of the throat with the ear-coverts, being light ferruginous; under tail-coverts also white; the wing and tarsus are both; in. longer; wings brown, the primaries margined exteriorly with pale dusky ferruginous, the secondaries with ashy olive; extreme edge of wing, under spurious wing-coverts, and exterior margin of the latter, ferruginous white, contrasting with the ash on the breast; under wing-coverts white. Other characters as in the description above.

## 491. ORTHOTOMUS RUFICEPS, Lesson Sp.

Edela ruficeps, Less., Tr. d'Ornith. p. 309 (1831) (nec. Less., Cent. Zool.).

Orthotomus ruficeps, Moore, P. Z. S. (1854), p.

Orthotomus sericeus, Temm., Text de Pl. Col. 599 (1836).

white; the sides, the thighs, and the abdomen, of a yellow citron; back and wings of a greenish tint, the quills and tail margined with greenish; upper mandible brown, the lower, as well as the feet, yellowish."—(Temm.)

## ORTHOTOMUS ATROGULARIS, Temm.

Orthotomus atrogularis, Temm., Text de Pl. Col. 599. G. R. Gray, Gen. of Birds, 1. p. 162. Bonap., C. G. Av. p. 282. Moore, P. Z. S. (1854), p.

The Black-throated Tailor-bird.

HAB. Malacca, Borneo, Temminck.

"This species is the smallest of the genus. The forehead, top of the head, and the occiput, bright brownish-red; the neck, the back, and the wings, of a grassy-green; the tail of a yellowish-green, marked near the end, and on the inner web, with a narrow yellowish band; the chin, throat, breast, and upper parts of flanks, pure black; the sides of the abdomen yellowish; middle of the belly and abdomen white; bill and feet brown. No difference in the sexes. Length 31 in."—(Temm.)

#### The Rufous-headed Tailor-Bird.

#### A. Malacca. Purchased.

This species may readily be distinguished by the bright colour of the head, the tail also being of the same colour, but not so bright; and the bill being considerably longer and stouter (though strictly typical) than in the other species. Length  $4\frac{1}{4}$  in., wing 2 in., tail  $1\frac{3}{4}$  in., bill to gape  $\frac{7}{8}$  in., and tarsus  $\frac{8}{10}$  in.

The Indian Tailor-Bird, Pennant.

PHUTKI, Hind., Jerdon.

TUNTUNI, Beng., Hamilton. Blyth.

PATIA ('Leaf-bird'), Nepal, Hodgs.

- A. B. C. & Q (O. Bennettii et O. lingoo, Sykes).

  Dukhun. Presented by Colonel Sykes.
- d. e. f. (O. sutoria et O. patia, Hodgs.). Nepal. Presented by B. H. Hodgson, Esq.
- g. Drawing of bird, nest, and eggs, natural size. From Dr. F. (B.) Hamilton's Collection.

The earliest notice of this long-celebrated bird is found in "Pennant's Indian Zoology," a classical work which combines various fragments of zoology collected by Forster, Loten, and other early Indian zoologists. The systematic name was first given by Gmelin. After various interesting remarks on Indian Zoology, Pennant describes the nest of the Tailor Bird as follows: "The bird picks up a dead leaf, and, surprising to relate, sews it to the side of a living one, its slender bill being its needle, and its thread some fine fibres; the lining feathers, gossamer, and down."

The bird is subsequently described by most Indian ornithologists. Mr. Jerdon remarks: "The Tailor Bird is tolerably common in most wooded districts, and universally spread, frequenting cultivated ground, especially gardens, groves of trees, and is also found in high jungle in the more open spaces. It lives in pairs or in small flocks, incessantly hopping about the branches of trees and shrubs, peas, and other vegetables, with a loud reiterated note, and picking various insects (chiefly ants and small larvæ) off the bark and leaves, and not unfrequently seeking them on the ground. It has the habit of frequently jerking up its tail while feeding, or hopping about, and at times (especially when calling) it has the power of raising the feathers on the lower part of its throat, and displaying on either side a small black stripe. This has been noted by no one except Lieutenant Hutton, who states: 'It is only seen when the bird is in motion, and wholly disappears when in a state of rest.' various notes, one of which sounds like twee, twee, as mentioned by Colonel Sykes, and another which is generally used when alarmed or angry, and sounds like chick, chick, chick, chick, chick, a familiar bird, and ventures close to houses, but when observed becomes wary."

The following are a few observations on the structure of two specimens of the nest of the present bird, which were found in the garden belonging to Captain Hearsey, by Lieutenant Hutton. "The first was neatly formed of raw cotton and bits of cotton threads woven strongly together, thickly lined with horse-hair, and supported between two leaves on a twig of the amaltús tree (Cassia fistula). These two leaves were first placed longitudinally upon each other, and stitched in that position from the points to rather more than half way up the sides with a strong thread spun from the raw cotton by the bird, leaving the entrance to the nest at the upper end, between the stalks of the leaves, at the point where they join the branch of the tree. Both of these leaves were, of course, green and living; subsequently, however, they were blown down by a high wind, and being now withered, the nest appears enclosed between two dead leaves.

"The second specimen was at the end of a branch of the *Bhela* (Semecarpus anacardium), about two feet from the ground, and constructed of the same materials as the above, viz., raw cotton, cotton threads, also a little flax, and lined with horse-hair alone; the leaves were stitched together partly with thread prepared by the bird, and partly with spun thread, and so well concealed was it, that even after Captain Hearsey had discovered it (by accident), he could scarcely find it again to show to me. In it were found an egg and two young birds nearly fledged; these I placed with the nest in a trap cage, and thus succeeded in capturing both of the old birds.

"The young birds are similar in colour to the adults, except that they are paler, and the top of the head cinereous with a faint rufous tinge; bill yellowish; the eggs are white, spotted, chiefly at the larger end, with tawny spots.

"They are very lively little birds, exhibiting a good deal of the manner of the creeper tribe (Cinnyris), carefully searching beneath every leaf and into every chink and hole for insects, which they seize with great rapidity, flirting their tails up and down, and uttering a sharp reiterated cry."

In another notice, the same author states: "Similar nests and eggs agreeing in every respect as those described above have since fallen under my observation; in all of these, the nest was composed of cotton, wool, vegetable fibre, and horse-hair, formed in the shape of a deep cup or purse, enclosed between two long leaves, the edges of which were sewed to the sides of the nest, in a manner to support it, by threads spun by the bird; the eggs are three to four, of a white colour, sprinkled with small specks, chiefly at the larger end, of rufous or tawny."

Dr. Nicholson gives the following notice: "I have found its singularly sewn nest containing eggs or young at all seasons of the

year, in May and in November; and this may be owing to the vegetation of gardens being always kept up by means of artificial irrigation; for cultivated spots seem its favourite, if not exclusive, resort, at least in the north of India. Though no doubt it haunts suitable jungles. I never observed it there, nor ever discovered its nest so situated; but I have found many nests in my gardens, both at Surat and at Raghote, as well as in Cutch. It seems to prefer the leaf of the Bringal (Solanum esculentum), or that of the Cucurbita octanqularis, for the purposes of nidification; and it lays four small white eggs, marked with faint dark spots at the larger end. After selecting a fitting leaf, it proceeds by means of its feet and beak to draw the edges together, perforating holes therein, and securing their proximity by threads of cotton, with bunches at the end to prevent their giving Then the nest is constructed inside the leaf, now forming a sort of cove, with cotton; the entrance is at the top, and the nest seems small in proportion to the bird."

The Tailor Bird is found in India generally, Ceylon, the Burmese countries, and the Malayan peninsula.

Further notices of the habits and nest of this curious bird will be found by the following authors in the references above referred to, viz., Hodgson, Sykes, Blyth, Layard, &c.

d. e. Nepal (No. 890, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., June, 1853.

"This species constructs the same ingenious nest and has the same note, 'tooec tooce,' and feeds in the same manner as the Orthotomus longicauda. It is remarkable for a struggling flight, as if it experienced difficulty in making its way."—(Sykes.)

"Is unequally distributed over the peninsula, being tolerably common in some localities and rarely met with in others. In the Carnatic, I have met it among reeds and long grass, by the side of rivers and tanks; on the west coast, in similar situations, and much more common; while I have hitherto seen it but rarely in the tableland; on the Neilgherries near Coonoor and Kotagherry, it is very

abundant in dry bushy ground. I have not verified Col. Sykes's observation as to its nidification, and have found the nest of another species to be very different."—(Jerdon.)

## 496. PRINIA HODGSONI, Blyth.

Prinia Hodgsonii, Blyth, J. A. S. Beng. XIII. p. 376 (1844); XVI. p. 456; Cat. B. Mus. A. S. Beng. p. 143. G. R. Gray, Gen. of Birds, I. p. 162. Hodgs., Cat. B. of Nep. p. 63. Bonap., C. G. Av. p. 284.

Prinia gracilis, apud Jerd., Madr. Journ. XI. p. 3. Small Wren-Warbler, Jerd.

- A. Bootan. From Pemberton's Collection.
- b. N. India. Presented by the Asiatic Society of Bengal.
- c. d. e. f. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

## 497. PRINIA CINEREOCAPILLA, Hodgson.

Prinia cinereocapilla, Hodgs. Moore, P. Z. S. (1854), p.

a. b. c. Nepal (No. 890\* Hodgs. Cat.). Presented by
 B. H. Hodgson, Esq., September, 1853.

Crown of the head grey, the shaft and margin of the feathers being darker; nareal and frontal plumes, a streak over and beyond the cye, and the whole under parts rufescent, brightest on the flanks and thighs; lores and upper parts of ear-coverts greyish; nape, back, rump, and wings bright rufous brown, the tips of the latter dusky; tail the same colour as the back, paler beneath, with a terminal dusky band, and rufescent white tips; bill black; legs pale horn. Length  $4\frac{1}{4}$  in., wing  $1\frac{\pi}{12}$  in., tail 2 in., bill to front  $\frac{\pi}{8}$  in., to gape  $\frac{\pi}{8}$  in., tarsus  $\frac{\pi}{4}$  in., middle toe and claw  $\frac{\pi}{12}$  in., hind ditto  $\frac{\pi}{12}$  in.

Genus Horeites, Hodgs. Gray's Zool. Misc. (1844), p. 82; P. Z. S. (1845), p. 30.

> NIVICOLA, Hodgs. Gray's Zool. Misc. (1844), p. 82; J. A. S. Beng. XIV. p. 586.

## 498. HOREITES POLLICARIS, Hodgs.

- Drymoica schistilata, G. R. Gray, Gen. of Birds, 1. p. 164.
- a. b. Nepal (No. 860, Hodgs. Catal.). Presented by B. H. Hodgson, Esq.

# 500. HOREITES BRUNNIFRONS, Hodgs.

- Horeites brunnifrons, Hodgs. Gray's Zool. Misc. (1844), p. 82; Cat. B. of Nep. p. 65, App. p. 151; Journ. A. S. Beng. XIV. p. 585.
- Prinia brunnifrons, Hodgs., P. Z. S. (1845), p. 29; Ann. N. H. XVI. p. 200.
- a. b. c. d. (No. 836, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., June, 1853.

"These birds inhabit the northern regions of Nepal, near the snows, dwelling in brushwood and being much on the ground."—(Hodgson.)

# 501. HOREITES MAJOR, Hodgson.

Horeites major, Hodgs. Moore, P. Z. S. (1854), p.

A. b. Nepal (No. 946, Hodgs. Catal.). Presented byB. H. Hodgson, Esq., October, 1853.

H. major. Above olive brown, ruddier on the wings; tail rounded, and of a dusky brown, with the outer webs fringed with olive brown; cap red-brown, a yellowish ferruginous superciliary streak extending over the ear-coverts; upper parts of ear-coverts ruddy brown, lower ashy; throat, sides of neck, centre of breast, and abdomen ashy white; sides of the breast and flanks olive brown; bill dark horn, yellowish at base beneath; feet yellowish. Length

5 in., of wing  $2\frac{1}{2}$  in., tail  $2\frac{9}{10}$  in., outer feather  $\frac{9}{8}$  in., shorter than the middle, bill to front  $\frac{9}{8}$  in., to gape  $\frac{9}{8}$  in., tarsus  $\frac{9}{10}$  in., middle toe and claw  $\frac{1}{10}$  in., inner ditto  $\frac{9}{10}$  in., outer ditto rather more than  $\frac{1}{2}$  in.

This species may easily be distinguished by its greater size, larger bill, and by the wings being much longer, though the latter are rounded as in the other species, and by the nearly total absence of ash colour on the under parts, the feet also being longer and stronger.

Genus Neornis, Hodgs. Gray's Zool. Misc. (1844), p. 82. Blyth, J. A. S. Beng. XIV. p. 590.

## 502. NEORNIS FLAVOLIVACEA, Hodgson.

The Grass-Warbler, Jerdon.

GHASKA PHUTKI OF GHASKA PITPITTEE, Hind., Jerd. KHER GHUSA, Bhagulpore, Blyth.

- A. B. Bengal. Presented by the Asiatic Society of Bengal.
- c. d. Nepal. Presented by B. H. Hodgson, Esq.

"This little bird abounds in suitable localities throughout the country, frequenting sedges and long grass, also growing corn and other low crops; it may be commonly observed to rise a little way into the air, as is the habit of so many birds that inhabit similar situations, repeating at intervals a single note, 'jik, jik.' It constructs a beautiful nest, sewing together a number of growing stems and leaves of grass with a delicate pappus, which forms also the lining; and laying four or five translucent white eggs, with reddish brown spots, more numerous and forming a ring at the large end, very like those of Orthotomus longicauda."—(Blyth.)

"When disturbed, it takes a short interrupted flight, and on seating itself hides among the tufts of grass, and often runs several yards. It feeds on ants, the larvæ of small grasshoppers, and various other insects."—(Jerdon.)

Suva, Nepal, Hodgson.

- A. b. Bootan. From Pemberton's Collection.
- c. d. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

"The favourite resort of the Siyx is the upland downs which are scattered with brushwood Owing to the feebleness of their wings, they need the shelter of low trees and shrubs; but they are almost

perpetually on the ground, seeking their food there exclusively. Small scaled insects are their favourite food, with larvæ; next grubs and caterpillars; berries they seldom touch; never grain nor hard seeds, nor consequently gravel."—(Hodgson.)

"This little bird appears on the hills at about 5,000 feet in May. A nest taken much lower down in June, was composed of grasses neatly interwoven in the shape of an ovate ball, the smaller end uppermost, and forming the mouth or entrance; it was lined first with cottony seed down and then with fine grass stalks; it was suspended among high grass, and contained five beautiful little eggs of a carneous white colour, thickly freckled with deep rufous, and with a darkish confluent ring of the same at the larger end. Diameter  $\frac{1}{16} \times \frac{s}{16}$  in. I have seen this species as high as 7,000 feet in October. It delights to sit on the summit of tall grass, or even of an oak, from whence it pours forth a loud and long-continued grating note, like the filing of a saw."—(Hutton.)

## 505. SUYA FULIGINOSA, Hodgs.

Decurus (Suya) fuliginosa, Hodgs. Gray's Zool. Misc. (1844), p. 82. Hodgs., Cat. B. of Nep., p. 63.

a. b. c. d. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

This species differs from S. criniger in having a more robust bill, which is entirely black; the feathers of the breast being dusky black, with rufescent white shafts and tips. The legs are also stouter.

# 506. SUYA ATROGULARIS, Moore.

Suya atrogularis, Moore, P. Z. S. (1854), p.

A. Darjeeling. From Pearson's Collection.

b. c. d. Nepal (No. 893, Hodgs. Catal.). Presented byB. H. Hodgson, Esq., October, 1853.

S. atrogularis. Colour above, dusky brown, in some specimens ashy brown; edge of wing at shoulder and under wing-coverts buff; primaries margined with buffish, and secondaries with rufescent-brown; a whitish streak extending from the base of the lower mandible to the end and under the ear-covert; chin, throat, side of neck, breast, and middle of abdomen black, the feathers of the two latter broadly centered with white; flanks and sides of abdomen mixed grey, brown, and rufescent; vent buff; thighs buffy-rufous;

tail of ten feathers, paler than the back, without perceptible terminal band; bill horn, feet paler. Length  $6\frac{1}{2}$  in., including the tail, wings from  $1\frac{3}{4}$  to 2 in. in some specimens, central feathers of tail from  $3\frac{1}{2}$  to 4 in., its outermost being only 1 in., bill to gape  $\frac{5}{12}$  in., to front  $\frac{5}{12}$  in., height from chin to front  $\frac{1}{10}$  in., width at chin  $\frac{2}{10}$  in., tarsi  $\frac{7}{8}$  in.

## 507. SUYA LEPIDA, Blyth.

Drymoica lepida, Blyth, J. A. S. Beng. XIII. p. 376 (1844); XVI. p. 460; Cat. B. Mus. A. S. Beng. p. 143. G. R. Gray, Gen. of Birds, I. p. 164.

Suya lepida, Bonap., C. G. Av. p. 281.

- a. Shikarpore. From Griffith's Collection.
- b. Bengal. Presented by the Asiatic Society of Bengal.

This species may be distinguished by the "general light olive-grey colour above, each feather having a medial dusky streak, broader on those of the crown and back; wings light dusky brown, the feathers margined with olive-grey, and tail throughout distinctly branded above with narrow transverse duskyish lines, below pale, with whitish tips, and a subterminal dusky band to each feather; the under parts throughout are greyish white, with lores and a slight supercilium of the same. Length  $4^\circ_1$  to  $5^\circ_1$  in., tail varying from  $2^\circ_8$  to  $2^\circ_8$  in., with its outermost feathers from 1 to  $1^\circ_4$  in. less, alar expanse  $5^\circ_4$  to  $5^\circ_2$  in., closed wing  $1^\circ_4$  in., bill to gape  $\frac{1}{2}$  in., tarse  $\frac{5}{8}$  in. Irides bright yellowish brown; bill plumbeous, paler (and sometimes carneous) below; legs pale carneous, with a faint tinge of yellow."

"This bird inhabits low scrub, intermixed with tufts of coarse sedgy grass, growing in sandy places by the river side, and it frequently flies out to feed among the thin herbage growing along the margin of the sand-dunes."—(Blyth.)

Genus Drymoica, Swains., Zool. Journ. (1827).

The Common Wren-Warbler, Jerdon.

- A. B. Dukhun. Presented by Colonel Sykes.
- b. Bengal. Presented by the Asiatic Society of Bengal.
- c. Nepal (No. 957, Hodgs. Cat.). Presented by B. II. Hodgson, Esq., September, 1853.
- d. Bengal. Presented by Captain R. C. Tytler, February, 1854.

"This is a common bird in all parts of the Peninsula, frequenting low bushes on the open plains, hedges, low trees, grain-fields, &c. It is found generally in pairs, or sometimes in small flocks; feeds on ants, larvæ, and other insects, and endeavours to conceal itself in the thick bushes or hedges, and on being driven away, flies off to the nearest bush or tree with a low jerking flight. I once procured the nest of this species: it was open at the top, neatly made with grass well interwoven, without any lining, and fixed in a low bush very near the ground; it contained four blue eggs."—(Jerdon.)

# 511. DRYMOICA NIPALENSIS, Hodgson.

Drymoica nipalensis, Hodgs. Moore, P. Z. S. (1854), p.

a. b. Nepal (No. 913, Hodgs. Catal.). Presented by
 B. H. Hodgson, Esq., September, 1853.

D. nipalensis. Above rufous brown; wings dusky brown; the primaries exteriorly, and secondaries interiorly and exteriorly,

<sup>\*</sup> Previously used by Latham.

margined with bright rufous-brown; tail rufous-brown, paler beneath, and distinctly rayed; has a terminal dusky band, seen most conspicuous above, the tips being pale but not white; the whole under-parts rufescent, as in *Prinia socialis*, Sykes; bill dusky horn, paler below at base; legs pale horn. Length  $4\frac{1}{2}$  to 5 in., wing  $1\frac{10}{12}$  in. tail varying from  $2\frac{1}{2}$  to 3 in., bill to front  $\frac{4}{12}$  in., to gape  $\frac{7}{12}$  in., tarsi  $\frac{10}{12}$  in., middle toe and claw  $\frac{8}{12}$  in., hind ditto  $\frac{7}{12}$  in.

c. d. Dacca. Presented by Capt. R. C. Tytler, Feb., 1854.

"This is an uncommon bird; in its manners it somewhat approaches the Orthotomi and Prinic. I have seen it in the Carnatic, near Trichinopoly, also near Jaulnah, and in other parts of the tableland. It frequents high grain fields, to the stalks of which it clings, and, on being observed, conceals itself among them. At Jaulnah, I have seen it in my garden, hunting about various low shrubs, peas, and beans, &c., among which, on being observed, it immediately withdrew, most carefully hiding itself, and being with difficulty driven from its place of refuge. I occasionally heard it utter a harsh clucking note. I found its food, in two instances, to consist of small grasshoppers and ants."—(Jerdon.)

"This bird is very common throughout the Peninsula, and comes a good deal into gardens, frequenting pea-rows and the like. In wilder marshy districts, such as the swampy thickets in the vicinity of the salt-water lake near Calcutta, not one is to be met with, while A. brunnescens abound; and A. agricola is rarely seen in the haunts of A. dumetorum."—(Blyth.)

"This species arrives in the hills, up to 7,000 feet at least, in April, when it is very common, and appears in pairs, with something of the manners of Phylloscopus. The note is a sharp 'tchik-tchik,' resembling the sound emitted by a flint and steel. It disappears by the end of May, in which month they breed; but, owing to the high winds and strong weather experienced in that month in 1848, many nests were left incompleted, and the birds must have departed without breeding. One nest, which I took on the 6th May, was a round ball, with a lateral entrance; it was placed in a thick barberry-bush growing at the side of a deep and sheltered ditch; it was composed of coarse dry grasses externally, and lined with finer grass. Eggs three, and pearl-white, with minute scattered specks of rufous, chiefly at the larger end; diameter  $\frac{1.0}{1.6} \times \frac{\kappa}{1.6}$  in."—(Hutton.)

Mr. Jerdon states: "It is certainly migratory in the south of India."

- A. cantator. "Plumage above, clear olive-green; crown black,

with a longitudinal central yellow stripe; black stripe through the eye and a yellow one over it; throat bright yellow, extending towards the breast; lower parts lint-white; vent yellow. Length 4 in. Male."—(Tickell.)

"Frequents trees in the thickest parts of the jungle, and has a loud and incessant note, like 'pio, pio, pio, pio.'"—(Tickell.)

#### 531. ABRORNIS SCHISTICEPS, Hodgson.

Abrornis schisticeps, Hodgs., Gray's Zool. Misc. (1844), p. 82. Hulton, J. A. S. Beng. XVII. pt. 2, p. 688. Culicipeta schisticeps, Hodgs., Cat. B. of Nep. p. 67, et App. p. 153.

a. b. c. d. Nepal. Presented by B. H. Hodgson, Esq.

A. schisticeps. Crown, occiput, and ear-coverts, greyish slate, passing to olive-green on the shoulders, back, and rump; wings and tail duksy, margined with olive-green; the inner webs of the outer tail-feathers white; abdomen white; a broad streak from the front, above each eye, the throat, breast, and vent, bright yellow; lores, base of lower mandible, under and over the eye, black; bill and feet horny. Length  $3\frac{1}{2}$  in., of wing  $1\frac{9}{10}$  in., tail  $1\frac{3}{4}$  in., bill from front  $\frac{3}{10}$  in., to gape  $\frac{5}{10}$  in., and tarse  $\frac{8}{10}$  in.

"A common species at 5,000 feet, and commences building in March. A pair of these birds selected a thick China rosebush trained against the side of the house, and had completed the nest and laid one egg, when a rat destroyed it. I subsequently took two other nests in May, both placed on the ground, in holes in the side of a bank by the roadside: in form, the nest is a ball with a round lateral entrance, and is composed externally of dried grasses and green moss, lined with bits of wool, cotton, feathers, thread, and hair. The eggs are three in number, and pure white; diameter  $\frac{1}{16} \times \frac{1}{16}$  in."—(Hutton.)

Abrornis erochron, *Hodgs.*, *Gray's Zool. Misc.* (1844), p. 82; *Cat. B. of Nep. p.* 66, et App. p. 152. Bonap., C. G. Av. p. 291.

Regulus erochroa, G. R. Gray, Gen. of Birds, I. p. 175. Abrornis pulchra, Hodys., Gray's Zool. Misc. (1844), p. 82 (the young).

a. Nepal. Presented by B. H. Hodgson, Esq.

#### 534. ABRORNIS ALBOGULARIS, Hodgson.

Abrornis albogularis, Hodgs. Moore, P. Z. S. (1854), p.

A. B. Nepal (No. 936, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

A. albogularis. Forchead, lores, over and under the eyes to nape, and ear-coverts, brightish ferruginous, the crown being dusky ferruginous, passing to yellowish olive-green on the back and shoulders, the rump being yellowish; wings black, margined with the colour of the back; tail pale dusky greenish, edged exteriorly throughout with yellowish green; base of lower mandible and throat white, the feathers of the latter black at the base; breast bright yellow; abdomen white; vent yellowish; bill horny, paler beneath; feet pale horny; the rictorial bristles black, strong, nearly as long as the bill. Length  $3\frac{1}{2}$  in., of wing  $1\frac{3}{4}$  in.; the first quill  $\frac{1}{2}$  in. shorter than the second; third  $\frac{7}{10}$  in. longer than the first; fourth, fifth, sixth, nearly equal, the fifth being longest; tail  $1\frac{1}{2}$  in.; bill to frontal plumes  $\frac{3}{12}$  in., to gape  $\frac{5}{12}$  in., tarsus  $\frac{a}{10}$  in., middle toe and claw  $\frac{5}{2}$  in., hind ditto  $\frac{3}{8}$  in., tarsus and hind claw strong.

## 535. ABRORNIS POLIOGENYS, Blyth Sp.

Culicipeta poliogenys, Blyth, J. A. S. Beng. XVI. p. 441 (1847).

Abrornis poliogenys, Blyth, Cat. B. Mus. A. S. Beng. p. 183. Moore, P. Z. S. (1854), p.

Rhipidura poliogenys, G. R. Gray, Gen. of Birds, III. App. p. 12.

a. b. c. d. Nepal (No. 920, Hodgs. Cat.). Presented by B. H. Hodgson, Esq., September, 1853.

A. poliogenys. Head and nape, base of lower mandible, and carcoverts, dark ash-grey, the loral feathers tipped with greyish white; round the eye a clear white ring; back, rump, and shoulders, bright olive-green; wings dusky black, margined with olive-green, the greater coverts tipped with whitish yellow; throat greyish white; the rest of the under-parts clear yellow; tail dusky on the six central feathers, which are margined with olive-green, the three outer being greenish dusky on the terminal half of the outer web, the basal half with the whole of the inner web being white; upper mandible blackish horn; lower yellowish; feet yellowish horn. Length about  $4\frac{1}{4}$  in., of wing 2 in., tail  $1\frac{3}{4}$  in., bill to front  $\frac{3}{10}$  in., to gape  $\frac{1}{2}$  in., and tarse the same.

536. ABRORNIS AFFINIS, Hodgson.

Abrornis affinis, Hodgs., Moore, P. Z. S. (1854), p.

a. Nepal (No. 920\*, Hodgs. Cat.).† Presented by B. H. Hodgson, Esq., September, 1853.

This species is closely allied to A. poliogenys, but differs from it in having the lores, base of lower mandible, lower portion of the ear-coverts, chin and throat, the same bright yellow as the rest of the under-parts; the feathers of the crown are pale shafted, which does not appear in poliogenys; the tail is pale dusky, the two outer feathers only being white on the apical portion of the inner web, the basal portion of which is dusky; the outer web in both is pale dusky green; the other ten are fringed with greenish on the outer web. The wing in affinis is \(\frac{1}{4}\) in. longer, but has the same markings; the tarsus is also longer by \(\frac{1}{10}\) in.: other characters agree in both species. The bill in this and poliogenys is broader than in A. xanthoschistos, H.

- A. Bengal (*P. modestus*, Bl.). Presented by the Asiatic Society of Bengal.
- Nepal (P. reguloides, H., No. 862 in Catal.). Presented by B. H. Hodgson, Esq.

"This bird is solitary, and its song-note is nearly similar to that of Ph. sibilatrix, but considerably weaker. Its nest is an elegant structure, a specimen of which I procured, together with the birds attached; it was pendent from a twig of Guara, and was placed at a considerable height from the ground, being of a domed form, with two apertures, one in front above the middle, having a distinct overhanging canopy, the other on one side behind, placed rather higher up: the upper part is attached throughout its breadth to the twig. The body of the nest is constructed of a fine and soft vegetable fibre, like fine tow, closely interlaced to the thickness of half an inch, and this forms the internal lining; the domed part is much less substantial, though sufficiently strong behind where the lower part is supported. Outside are affixed a number of bits of bark, spider cocoons, and a variety of other substances, recalling to mind the external lining of the nest of the European Bottle-tit, which latter nest is fully double the size, but its single orifice is scarcely so large. There were no eggs in this nest, the outer lining of which was not completely finished."—(Blyth.)

The Lesser White-Throat. Cheea, Sindh, Blyth.

- a. b. Afghanistan. From Griffith's Collection.
- c. N. India. Presented by John Gould, Esq.

Mr. Blyth remarks: "I shot a pair of these birds about 100 miles above Calcutta. I observed many of them frequenting the baubul *Mimosæ* in little parties, and, as in England, keeping chiefly to the trees, and not to low bush-covert, as is the habit of *S. cinerea*."

#### Subfam. IV. MOTACILLINA, Vigors.

Genus Enicurus, Temminck, Text de Pl. Col. 113 (182-).

### 544. ENICURUS LESCHENAULTI, Vieillot Sp.

Turdus Leschenaultii, Vicill., N. Dict. d'Hist. Nat. XX. p. 269; Gal. des Ois. t. 145. G. R. Gray, Gen. of Birds, I. p. 204. Bonap., C. G. Av. p. 251.

Motacilla speciosa, Horsf., Trans. Linn. Soc. XIII. p. 155; Zool. Res. in Java, t. Lath., Hist. VI. p. 319.

Enicurus coronatus, Temm., Pl. Col. 113.

Leschenault's Enicurus.

CHENGINGING OF KINGKING, Java, Horsf.

A. B. and Drawing. Java. From Dr. Horsfield's Collection.

"This bird is exclusively found near small rivulets: in the beds of these, particularly where they abound with rocks and gravel, it is seen running along with alacrity, moving its tail incessantly, and picking up worms and insects. It is very locally distributed, and uniformly deserts the neighbourhood of populous villages. It is almost entirely confined to the southern coast of Java, which abounds in small streams, descending rapidly from the southern hills, and shaded by luxuriant shrubs. Here I first discovered this bird, in the district of Pajittan, in the year 1809; I afterwards met with it again, along this coast, in the district of Karang-bollong, and in the provinces south of Kediri. Among more central situations, it frequents the banks of an elevated lake near the declivities of the mountain Prahu, where I found it more numerous than in any other part of Java. In the extensive forests of Pugar and Blambangan,

I never noticed it, although I devoted a considerable time to their examination."—(Horsfield.)

### 545. ENICURUS FRONTALIS, Blyth.

Enicurus frontalis, Blyth, J. A. S. Beng. XVI. p. 156; Cat. B. Mus. A. S. Beng. p. 159. Bonap., C. G. Av. p. 251.

a. b. Malacca. Presented by Dr. Theodore Cantor, April, 1854.

This species is at once distinguished from *E. Leschenaulti* by its smaller size, being little more than half its size, and by its less-developed white frontal crest, its shorter wings and tail, and by its smaller feet.

#### 546. ENICURUS SCHISTACEUS, Hodgson.

Enicurus schistaceus, Hodys., As. Res. XIX. p. 189 (1836). Gray's Zool. Misc. (1844), p. 83; Catal. B. of Nep. p. 76. G. R. Gray, Gen. of Birds, 1. p. 204. Blyth, J. A. S. Beng. XVI. p. 157; Cat. B. Mus. A. S. Beng. p. 159. Bonap., C. G. Av p. 251.

The Slaty Enicurus, Gray.

A. Bootan. From Pemberton's Collection.

b. c. Nepal. Presented by B. H. Hodgson, Esq.

### 547. ENICURUS IMMACULATUS, Hodgson.

Enicurus immaculatus, Hodgs., As. Res. XIX. p. 190.
Gray's Zool. Misc. (1844), p. 83; Cat. B. of Nep.
p. 76. G. R. Gray, Gen. of Birds, I. p. 204.
Blyth, J. A. S. Beng. XVI. p. 157; Cat. B. Mus.
A. S. Beng. p. 159. Bonap., C. G. Av. p. 351.

The Unspotted Enicurus, Gray.

TSAM-RENG-KYA, Arracan, Blyth.

- A. Afghanistan. From Griffith's Collection.
- b. From the Asiatic Society of Bengal.

## 548. ENICURUS MACULATUS, Vigors.

Enicurus maculatus, Vigors, P. Z. S. (1831), p. 9. Gould, Cent. of Birds, t. 27. Hodgs., Gray's Zool. Misc. (1844), p. 83; Cat. B. of Nep. p. 76. Jameson, Calc. Journ. Nat. Hist. VII. p. 363. G. R. Gray, Gen. of Birds, I. p. 204. Blyth, J. A. S. Beng. XVI. p. 156; Cat. B. Mus. A. S. Beng. p. 159. Bonap., C. G. Av. p. 251.

Enicurus fuliginosus, Hodgs., As. Res. XIX. p. 190 (the young).

The Spotted Enicurus, Gray.

Khunjun, Hills, Royle.

A. b. c. d. Nepal. Presented by B. H. Hodgson, Esq.

"This appears to be a very common Himalayan species, and occurs rarely in Arracan."—(Blyth.)

Dr. Jameson remarks: "Is common; two or three being met with on every mountain-stream."

### 549. ENICURUS VELATUS, Temminck.

Enicurus velatus, Temm., Pl. Col. 160. G. R. Gray, Gen. of Birds, I. p. 204. Bonap., C. G. Av. p. 251.

A. Java. From Dr. Horsfield's Collection.

#### 550. ENICURUS SCOULERI, Vigors.

Enicurus Scouleri, Vigors, P. Z. S. (1831), p. 174. Gould, Cent. of Birds, t. 28. G. R. Gray, Gen. of Birds, I. p. 204. Hodgs., Cat. B. of Nep. p. 76. Jameson, Cale. Journ. Nat. Hist. VII. p. 363. Blyth, J. A. S. Beng. XVI. p. 157; Cat. B. Mus. A. S. Beng. p. 159. Bonap., C. G. Av. p. 251.

Enicurus Scouleri v. heterurus, Hodgs. Gray's Zool. Misc. (1844), p. 83.

Scouler's Enicurus, Gray.

A. B. Bootan. From Pemberton's Collection.

"This species is excessively rare in the Himalayas."—(Jameson.)

Genus Motacilla, *Linn.*, S. N. (1748).

#### 551. MOTACILLA MADERASPATANA, Brisson.

Motacilla maderaspatana, Briss., Orn. III. p. 478. Lath.,
Hist. VI. p. 319. Blyth, J. A. S. Beng. XVI.
p. 428; Cat. B. Mus. A. S. Beng. p. 137. Bonap.,
C. G. Av. p. 251. Layard, Ann. N. H. (1853),
p. 268.

Motacilla maderapatensis, Gmel., S. N. L. I. p. 961. Jerd., Madr. Journ. XI. p. 10. G. R. Gray, Gen. of Birds, I. p. 203. Gould, B. of Asia, t. 85.

Motacilla variegata, Steph. Shaw's Gen. Zool. XIII. p. 234. Sykes, P. Z. S. (1832), p. 91. McClell., P. Z. S. (1839), p. 101.

Motacilla picata, Frankl., P. Z. S. (1831), p. 119.

Pied Wagtail, Lath., Hist. p. 320, t. 104.

The Great Pied Wagtail, Gould.

MHAMOOLA, Hind., Jerdon.

A. B. J. Dukhun. Presented by Colonel Sykes.

c. d. of Q. Afghanistan. From Griffith's Collection.

e. Kumaon. From Captain R. Strachey's Collection.

f. g. d ?. Nepal (No. 902 Hodgs. Cat.). Presented by B. H. Hodgson, Esq., September, 1853.

"This is distributed over the whole of the Indian peninsula, with the exception of lower Bengal, where Mr. Blyth states it is not found, and it is also included in Mr. Layard's 'List of the Birds of Ceylon.' Mr. Jerdon mentions: "Found only in beds of rivers;" and Captain Boys states that it "is very nimble on its legs, and runs with great facility, constantly jerking its tail, and, like the other members of the genus, making occasional jumps after flies and other insects. It is not so common as the other Indian species, and differs much in weight, according to the season, but generally averages between nine and ten drachms."—(Gould.)

### 552. MOTACILLA ALBA, Linn.

Motacilla alba, Linn., S. N. I. p. 331. Lath., Hist. VI. p. 315. Macgill, Hist. Brit. B. II. p. 221. Gould, B. of Eur. t. 143. G. R. Gray, Gen. of Birds, 1. p. 203; Cat. Brit. B. in B. M. p. 70. Blyth, Cat. B. Mus. A. S. Beng. p. 137. Bonap., C. G. Av. p. 250.

The White Wagtail, Yarrell.

a. Tangier. Presented by John Gould, Esq.

## 553. MOTACILLA LUZONIENSIS, Scopoli.

Motacilla luzoniensis, Scopoli. Blyth, Ann. Nat. Hist. XIII. p. 37. G. R. Gray, Gen. of Birds, I. p. 203.

Hodgs., Cat. B. of Nep. p. 75. Blyth, J. A. S. Beng. XVI. p. 429; Cat. B. Mus. A. S. Beng. p. 137.

Motacilla xanthoschistos, *Hodgs.*, *Gray's Zool. Misc.* (1844), p. 83.

Motacilla bistrigata, Raffles, Trans. Linn. Soc. XIII. p. 312.

Pallenura javensis, Bonap., C. G. Av. p. 250.

The Grey Wagtail, Bewick.

Wood or Jungle Wagtail, Jerdon.

LETTI LETTI, Sumatra, Raffles.

- A. Bengal. Presented by the Asiatic Society of Bengal.
- b. Kumaon. From Captain R. Strachey's Collection.
- c. Bootan. From Pemberton's Collection.
- d. c. Nepal (M. xanthoschistos, Hodgs.). Presented by B. H. Hodgson, Esq.
- f. Drawing. Sumatra. (M. bistrigata, Raffles). From Sir T. S. Raffles's Collection.
- g. Pinang. Presented by Dr. Cantor, April, 1854.
- "This European species is common throughout India and Malaisa; specimens from Java absolutely resembling those from England."—(Blyth.)
- "Not uncommon at Candahar during the autumn, winter, and spring months, but departs when the great heats of summer set in."
  —(Hutton.)
- "This species is numerous on the Neilgherries, where it frequents running streams, also enters gardens, &c. It is very abundant on the passes leading up to the hills, hopping along the road, and flying before a traveller, often for some distance. I have once or twice seen it lately in woody streams in the more northern portion of the table-land, during the cold weather only."—(Jerdon.)

Genus Budytes, Cuv., Règ. Anim. (1817), I. p. 371.

## 556. BUDYTES VIRIDIS, Gmel. Sp.

Motacilla viridis, Gmel., S. N. L. I. p. 962. G. R. Gray, Gen. of Birds, p. 203.

- d. Bengal. From Dr. Lord's Collection.
- e. Afghanistan. From Griffith's Collection.
- f. Kumaon. From Captain R. Strachey's Collection.
- g. Dacca. Presented by Lieutenant R. C. Tytler.

"This bird abounds in Bengal during the cold season, and, it would seem, in suitable localities throughout the country, frequenting groves and gardens, with a disposition to be social, if not gregarious; and where an extent of thin tree-jungle harbours them in considerable numbers, I have noticed that towards evening, they commonly fly to and fro over their haunts in scattered parties, now perhaps two or three, then several, and then perchance a solitary bird, each frequently uttering a slight chirp, and often several descending to alight for a while near together on the same tree; this restlessness they will continue to evince till it is getting dark, and it would scarcely be guessed what bird it was till one had been brought down. I never heard this species sing."—(Blyth.)

"In the south of India it is only a visitor during the cold weather, coming in October, and remaining till April or May. Associates generally in small flocks, frequenting beds of wooded streams, edges of tanks, and other moist places; it is also found in grain-fields, gardens, and groves of trees. It feeds partly on the ground, on various insects, and also on grain, and on being disturbed flies up to the nearest tree. It frequently, however, feeds on trees, hopping about the upper branches like a *Sylvia*, and occasionally even snapping at an insect on the wing. Mr. Elliot says: 'Its flesh is used by falconers as a restorative to the Bhyree (*Falco peregrinus*), and is said to be very delicate.'"—(Jerdon.)

Colonel Sykes says: "Found on open stony lands."

### 563. ANTHUS RICHARDII, Vieillot.

Anthus Richardii, Vieill., N. Dict. d'Hist. Nat. XXVI.

Common Indian Pipit.

RUGAIL, Hind., Jerdon.

- a. b. c. d. Nepal (A. ubiquitarius, Hodgs.), c. (A. fortipes, Hodgs.). Presented by B. H. Hodgson, Esq.
- f. Dacca. Presented by Captain R. C. Tytler, February, 1854.
- g. Canara. From S. N. Ward's Collection.
- h. Kumaon. From Captain R. Strachey's Collection.

"This is one of the commonest birds of Lower Bengal during the cold season, in all open places, and a few remain throughout the year. Habits, much as in A. pratensis, and song very insignificant, a mere repetition of one note, as often mounting some forty or fifty feet into the air, it descends sailing to the ground in the usual manner of the birds of this genus. It also appears to be generally diffused throughout India, as well as in the countries eastward of the Bay of Bengal."—(Blyth.)

## 567. ANTHUS MALAYENSIS, Eyton.

Anthus malayensis, Eyton, P. Z. S. (1839), p. 104. G. R. Gray, Gen. of Birds, I. p. 206.

Alauda pratensis, apud Raffles, Trans. Linn. Soc. XIII. p. 215.

The Malay Pipit.

LANCHA LANCHA OF HAMBA PUYU, Sumatra, Raffles.

- a. Drawing. From Sir T. S. Raffles's Collection.
- b. Malacca. From Griffith's Collection.
- c. d. e. f. Malacca. Pesented by Dr. Cantor.

## 568. ANTHUS ROSEACEUS, Hodgson.

Anthus roseaceus v. rufogularis, Hodgs., Gray's Zool. Misc. (1844), p. 83.

Anthus cervinus, apud Hodgs., Cat. B. of Nep. p. 76. Blyth, Cat. B. Mus. A. S. Beng. p. 136. Bonap., C. G. Av. p. 248.

Anthus aquatiens, apud Blyth, J. A. S. Beng. XVI. p. 437.

Anthus axillaris, Gould, MS.

The Rufous-throated Pipit.

- a. b. c. d. Nepal (A. roseaceus, Hodgs., No. 603, 734).

  Presented by B. H. Hodgson, Esq.
- e. f. Kumaon. From Captain R. Strachey's Collection.
- g. Olipore. From Griffith's Collection.
- h. Himalaya. Presented by John Gould, Esq.

This species may be distinguished by the throat, forepart of the neck, chest, and eyebrows being of a uniform delicate vinous purple, and by the axillaries being yellow.

#### 569. ANTHUS AQUATICUS? Bechstein.

a. Afghanistan. From Griffith's Collection.

Genus Macronyx, Swains., Nat. Hist. of Birds (1837).

#### 570. MACRONYX CAPENSIS, Linn. Sp.

The Alpine Accentor, Eyton.

A. England. Presented by John Gould, Esq.

### 573. ACCENTOR NIPALENSIS, Hodgson.

Accentor nipalensis, Hodgs., J. A. S. Beng. XII. p. 958 (1843); Gray's Zool. Misc. (1844), p. 83; P. Z. S. (1845), p. 31; Cat. B. of Nepal, p. 71. G. R. Gray, Gen. of Birds, 1. p. 187. Blyth, J. A. S. Beng. XV. p. 42; Catal. B. Mus. A. S. Beng. p. 130. Bonap., C. G. Av. p. 305.

Accentor cacharensis, *Hodgs.*, P. Z. S. (1845), p. 34. The Nepal Accentor, Gray.

A. Bootan. From Pemberton's Collection.

b. c. d. Nepal (A. nipalensis et A. cacharensis, Hodgs.). Presented by B. H. Hodgson, Esq., June, 1853.

### 574. ACCENTOR VARIEGATUS, Blyth.

Accentor himalayanus, Blyth, J. A. S. Beng. XI. p. 187.
Accentor variegatus, Blyth, J. A. S. Beng. XII. p. 958
(1843); Cat. B. Mus. A. S. Beng. p. 131. G. R. Gray, Gen. of Birds, I. p. 187. Bonap., C. G. Av. p. 305.

Accentor Alpinus, apud Vioill., Gal. des Ois. t. 156. The Varlegated Accentor.

A. b. Nepal (No. 964, Hodgs. Catal.). Presented byB. H. Hodgson, Esq., September, 1853.

This species differs from A. nipalensis by its smaller size, being little larger than A. modularis, and by the markings on the throat extending to the ear-coverts; from thence the whole under-parts are ferruginous, the feathers of the abdomen being broadly margined with white, and some having dark streaks on the flanks posteriorly. It has also a pale line over the eye.

## 575. ACCENTOR MODULARIS, Linn. Sp.

Motacilla modularis, Linn., S. N. I. p. 329.

A. England. Presented by John Gould, Esq.

## 576. ACCENTOR STROPHIATUS, Hodgson.

Accentor strophiatus, Hodgs., J. A. S. Beng. XII., p. 959; Gray's Zool. Misc. (1844), p. 83; P. Z. S. (1845), p. 31; Catal. B. of Nepal, p. 72. G. R. Gray, Gen. of Birds, I. p. 187, t. 51. Blyth, Cat. B. Mus. A. S. Beng. p. 131. Bonap., C. G. Av. p. 305.

The Rufous-breasted Accentor, Gray.

a. b. c. d. Nepal. Presented by B. H. Hodgson, Esq., June, 1853.

e. f. Kumaon. From Captain R. Strachey's Collection.

### 577. ACCENTOR HUTTONI, Moore.

Accentor atrogularis,\* Hutton, J. A. S. Beng. XVIII. p. 811 (1849). Blyth, Cat. B. Mus. A. S. Beng. p. 131. Bonap., C. G. Av. p. 305.

### A. b. Afghanistan. From Griffith's Collection.

A. atrogularis. "General colour above brown, the feathers contered dusky, more rufescent on the back, greyer on the nape, rump, and upper teil-coverts; crown darker; a broad line above the superciliary streak, with the ear-coverts and throat, dusky black, the latter divided from the ear-coverts by a pale line proceeding from the base of the lower mandible, and this, with the entire supercilium and the breast, of an uniform light rufescent-sandy hue; belly whitish, the flanks streaked with dusky; wing-coverts slightly-tipped albescent, forming slight cross-bands; bill dusky,

This name has been previously used by Dr. Brandt, for a species of this genus from Siberia.

yellowish towards the gape, and feet pale; irides brown. Length 6 in., of wing  $2\frac{7}{5}$  in., tail  $2\frac{1}{2}$  in., bill to gape  $\frac{9}{16}$  in., and tarse  $\frac{3}{4}$  in."

### 578. ACCENTOR RUBECULOIDES, Hodgson.

Accentor rubeculoïdes, Hodgs. Moore, P. Z. S. (1854), p. . .

A. b. Nepal (No. 970, Hodgs. Catal.). Presented byB. H. Hodgson, Esq., September, 1853.

A. rubeculoïdes. Forehead, crown, nape, ear-coverts, and chin, brown; infra-orbital feathers tipped with whitish; throat, sides of neck, and shoulder of wings, dingy grey-brown, the feathers of the throat blackish at base; back and rump ferruginous, centered with dusky; wings dusky, margined exteriorly with ferruginous; lesser and greater coverts tipped with white; tail dusky, margined exteriorly with pale ferruginous; breast and forepart of flanks ferruginous, the latter streaked with dusky; belly white, tinged with ferruginous on the flanks posteriorly, vent and margins of the under tail-coverts, the latter centered dusky; bill blackish; feet pale reddish. Length 6 in., of wing 3 in., tail  $2\frac{1}{2}$  in., bill to front  $\frac{1}{10}$  in., to gape  $\frac{1}{2}$  in., tarse  $\frac{3}{4}$  in.

## 579. ACCENTOR IMMACULATUS, Hodgson.

ntor immaculatus v. nipaleusis, Hodgs., Gray's Zool. Iisc. (1844), p. 83; P. Z. S. (1845), p. 34; Cat. B. of Nepal, p. 71, et App. p. 153. Moore, P. Z. S. (1854), p.

Accentor mollis, Blyth, J. A. S. Beng. XIV. p. 581 (1845); Cat. B. Mus. A. S. Beng. p. 131. G. R. Gray, Gen. of Birds, 111. App. p. 8. Bonap., C. G. Av. p. 306.

The Unspotted Accentor, Gray.

A. b. c. d. Nepal (No. 487, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., June, 1853.

A. immaculatus. "Upper parts a rich brown, passing into pure dark ash colour on the head and neck, and into maroon on the scapularies and tertiaries, and less deeply on the hind part of the back; coverts of the secondaries pure dark grey, those of the primaries, with the winglet, black, as are also the primaries, these last having their unemarginated portion externally bordered with pale grey; tail greyish dusky; frontal feathers to above the eyes

margined with white; the lores blackish; and the entire underparts slightly embrowned deep ash colour, as far as the vent, which is pale and tinged with ferruginous, the under tail-coverts being deeper ferruginous, and the hind portion of the flanks dark ferruginous; bill blackish; feet pale. Length 6 in., tail  $2\frac{1}{4}$  in., wing  $3\frac{1}{4}$  in., bill to front  $\frac{5}{16}$  in., tarse  $\frac{3}{4}$  in. Colouring soft and delicate."

"The species named nipalensis, strophiatus, and immaculatus, are found in the central and northern regions of the hills only, and chiefly in the northern. They avoid houses and cultivation. They breed on the ground, making a saucer-shaped nest of moss, well-compacted. They are much on the ground, and have an ambulatory structure of legs and feet."—(Hodgson.)

The Yellow-Bellied Leiothrix.

A. Bootan. From Pemberton's Collection.

b. c. d. e. Nepal. Presented by B. H. Hodgson, Esq.

f. Afghanistan. From Griffith's Collection.

"This bird is one of the indigenous and stationary species of Upper India, over the hilly parts of which it is generally diffused. It is, consequently, one of the commonest birds in all our collections. The older writers have also given China and Manilla as its habitats, but I believe, as yet, no examples have been received from either of those countries. It was procured by Captain Boys between Bumoric and Burthal, and by the late Hon. F. J. Shore in the Doon, where it would appear to be very abundant, as Mr. Shore mentions in his 'Notes' that he killed five at one shot, while engaged in picking up worms or insects from the dry gravelly bed of a stream from which the water had recently retired. It is there known to the natives by

the name of *Nance Chura*, and retires to the cold regions of the hills during the hot season. He further states that it builds in small bushes, where the underwood is tolerably abundant, a nest composed of grass and hair, and lays four or five eggs which are 'black spotted with yellow.' "—(Gould.)

In Nepal "it inhabits the central and hilly regions; feeds equally on grass-seeds and upon insects and their larvæ and pupæ."—(Hodgson.)

Pecila vinipecta, Bonap., C. G. Av. p. 230.

The Vinous-breasted Leiothrix.

## a. b. c. d. Nepal. Presented by B. H. Hodgson, Esq.

"In all the species of Leiothrix the tongue, without being elongated, is pointed, rather deeply forked, and more or less jagged on the edges, anteally. And in all, the stomach has a good deal of muscular power, being almost mediate between the typical Finches and Tits. In conformity with this structure the food is Parianofringillidan, consisting almost equally of insects, their nests, larvæ, and pupæ, and of seeds. (They explore opening buds so diligently that they might be called Bud-hunters. Their frontal plumes are, in consequence, frequently aggluminated by the pollen and viscid juices of plants and trees.) Berries are also frequently taken, but I never found gravel in the stomach of any, save one or two specimens of Calipyga (L. luteus)."—(Hodgson.)

SERAY SERAY, Malacca, Eyton.

- A. B. & Q, and Drawings. Assam. From McClelland's Collection.
- c. Nepal. Presented by B. H. Hodgson, Esq.
- d. J. Malacca. Presented by W. Griffith, Esq.
- e. f. 3 2. Malacca. Presented by Dr. Cantor, April, 1854.
- g. 3. Drawing. From Edward Blyth, Esq.

This bird inhabits "Nepal, Sikim, Bootan, Assam, and Sumatra." Mr. Hodgson states "it is found in the central and northern regions of the hills, passing into the southern in winter. Manners and habits typical. Explore foliage, feeding upon the softer arboreal insects, perfect and imperfect. Exceedingly fond of caterpillars. Occasionally take pulpy berries."

## 595. PARUS MONTICOLUS, Vigors.

Parus monticolus, Vigors, P. Z. S. (1831), p. 22. Gould, Cent. of Birds, t. 29, f. 2. Frankl., P. Z. S. (1831),

- G. and Drawing. Assam. From McClelland's Collection.

<sup>&</sup>quot;In Northern India this bird inhabits bamboo groves. It forms

its nest in hollow trees, and lives on insects."—(Dr. F. (B.) Hamilton, MS.)

"In Southern India," remarks Mr. Jerdon, "I have only seen this bird on the Neilgherries, where it is common in the woods, associating in small families, and feeding on various insects and seeds, to obtain which it occasionally resorts to the gardens. I have seen it once or twice only along the range of Northern Ghauts, but it probably is to be found all along the range of Western Ghauts."

## 597. PARUS XANTHOGENYS, Vigors.

Parus xanthogenys, Vigors, P. Z. S. (1831), p. 23.

Pæcila erythrocephala, Bonap., C. G. Av. p. 230.

The Red-headed Titmouse, Gray.

A. B. Bootan. From Pemberton's Collection.

c. d. e. f. Nepal. Presented by B. H. Hodgson, Esq.

"Common at Mussooree and in the Hills generally throughout the year. It breeds in April and May. The situation chosen is various, as one taken in the former month at Mussooree, at seven thousand feet elevation, was placed on the side of a bank among overhanging coarse grass, while another, taken in the latter month, at five thousand feet, was built among some ivy twining round a tree, and at least fourteen feet from the ground. The nest is in shape a round ball with a small lateral entrance, and is composed of green mosses, warmly lined with feathers. The eggs are five in number, white with a pinkish tinge, and sparingly sprinkled with lilae spots or specks, and having a well-defined lilae ring at the larger end. Diameter  $\frac{1}{16}$  in.  $\times$   $\frac{6}{16}$  in."—(Hutton.)

# 607. ORITES LEUCOGENYS, Moore.

Orites leucogenys, Moore, P. Z. S. (1854), p.

A. b. c. Afghanistan. From W. Griffith's Collection.

O. leucogenys. Colour above grey, tinged with pinkish on the rump; before the eye, and a broad streak over it, black, passing to mixed black and grey on the nape; the centre of the head dusky reddish-isabelline; base of lower mandible, below the eyes, ear-

coverts, and sides of the neck white; chin and throat jet-black; abdomen pale pinkish-isabelline; wings dusky, and having an isabelline tinge; the winglet and coverts of the primaries black, the primaries and secondaries fringed externally with grey; axillæ white; tail dusky, tinged with isabelline, the outer feathers graduated and obliquely tipped externally with white, the centre feathers margined with grey. Bill black; feet yellowish-brown. Length  $4\frac{1}{4}$  in., of wing  $2\frac{1}{8}$  in., tail  $2\frac{1}{4}$  in., the three outer feathers graduated, the middle pair  $\frac{1}{10}$  in. shorter than the next; bill to frontal plumes  $\frac{2}{8}$  in., to gape  $\frac{1}{12}$  in.; height from chin to front  $\frac{1}{12}$  in.

This species is allied to *P. jouschistos*, Hodgs., from which it may at once be distinguished by its broad, thick, and higher bill, by its white cheeks and ear-coverts, and by its black chin and throat; and from *P. crythrocephalus*, Vigors, by its larger size, by the absence of the white superciliary streak, white chin, and black ear-coverts.

"Found in pairs, in the woods above Balu Chughur, at four thousand feet elevation. Irides straw-colour." — (Griffith, MS. Notes.)

# 608. ORITES (?) JOUSCHISTOS, Hodgson Sp.

Parus jouschistos, Hodgs., Gray's Zool. Misc. (1844), p. 83; J. A. S. Beng. XIII. p. 943; Ann. Nat. Hist. XV. p. 326; Cat. Birds of Nepal, p. 73. G. R. Gray, Gen. of Birds, I. p. 192. Blyth, Cat. B. Mus. A. S. Beng. p. 104. Jard., Contr. to Ornith. (1852), p. 51.

- a. b. Bootan. From Pemberton's Collection.
- c. Nepal. Presented by B. H. Hodgson, Esq.

The following genus, which was enumerated in p. 169 of this CATALOGUE, is believed to be better placed at the end of the present sub-family.

Genus Falcunculus, Vieill., Analyse, p. 40 (1816).

# FALCUNCULUS LEUCOGASTER, Gould.

Falcunculus leucogaster, Gould, P. Z. S. (1837), p. 144.

a. b. Australia. From Mr. George Fradgley.

#### Subfam. IV. PARADOXORNINA.

Genus Paradoxornis, Gould, P. Z. S. (1836), p. 17.

Bathyrhynchus, McClell., Ind. Rev. II. p. 513 (1838).

Heteromorpha, Hodgs., J. A. S. Beng. XII. p. 448 (1843).

### 609. PARADOXORNIS FLAVIROSTRIS, Gould.

Paradoxornis flavirostris, Gould, P. Z. S. (1836), p. 17; Mag. Zool. and Bot. I. p. 62; Icones Avium, p. t. 6. McClell. (Horsf.), P. Z. S. (1839), p. 164. G. R. Gray, Gen. of Birds, II. p. 389. Blyth, J. A. S. Beng. XIV. p. 578. Bonap., C. G. Av. p. 500. Gould, Birds of Asia, t.

Bathyrhynchus brevirostris, McClell., Ind. Rev. (1838), p. 513 (with a figure).

A. and Drawing. Assam. From McClelland's Collection.
b. Nepal (No. 842, Hodgs. Catal.).\* Presented by B. H. Hodgson, Esq., June, 1853.

This bird inhabits the Eastern Himalayas, and the mountains of Assam and Nepal.

# 610. PARADOXORNIS UNICOLOR, Hodgson Sp.

Heteromorpha unicolor, *Hodgs.*, *J. A. S. Beng.* (1843), p. 448 (with a figure); Gray's Zool. Misc. (1844), p. 84. Blyth, J. A. S. Beng. XIV. p. 578.

Paradoxornis unicolor, Hodgs., Cat. Birds of Nepal, p. 111. G. R. Gray, Gen. of Birds, III., App. p. 18. Bonap., C. G. Av. p. 500. Gould, Birds of Asia, t.

A. Nepal (No. 843, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

"Inhabits the Cachar of Nepal, dwells in thick brushwood; frequently alights on the ground, but seems to feed aloft on bugs and other hard insects; in small flocks; not noisy."—(Hodgson.)

<sup>\*</sup> No. 885 was attached to this bird, which number, being previously occupied, this species is transferred to No. 842.

# 611. PARADOXORNIS RUFICEPS, Blyth.

Paradoxornis ruficeps, Blyth, J. A. S. Beng. XI. p. 177 (1842); XII. p. 1010 (with a figure). Tickell, J. A. S. Beng. XVI. p. 446. G. R. Gray, Gen. of Birds, II. p. 389, t. 94, f. 1. Bonap., C. G. Av. p. 500. Gould, Birds of Asia, t.

Heteromorpha ruficeps, Blyth, J. A. S. Beng. XIV. p. 578; Cat. B. Mus. A. S. Beng. p. 102.

A. B. Bootan. From Pemberton's Collection.

c. Nepal (No. 972 Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

"Inhabits the mountains of Bootan, Arracan" (and Nepal).—(Blyth.)

Captain Tickell remarks: "I have killed several specimens of this bird, and watched it in its wild state at Geeng, near Darjeeling; and I cannot agree in opinion with those who would class its group among the *Crateropodines*. This bird is a great devourer of grain (maize, rice, and buckwheat, which last is common about Nepal). It perches on the tops of high trees, as well as bushes, when off its feed; and in fact shows nothing in its manners of the thicket-loving, skulking, habits of the *Crateropodines*."

### 612. PARADOXORNIS GULARIS, Horsfield.

Paradoxornis gularis, Horsf., MSS. G. R. Gray, Gen. of Birds, II. p. 389, t. 94, f. 2 (1845). Bonap., C. G. Av. p. 500. Gould, Birds of Asia, t.

Paradoxornis caniceps, Blyth, J. A. S. Beng. XVIII. p. 810 (1849).

Heteromorpha (? Paradoxornis) caniceps, Blyth, Cat. B. Mus. A. S. Beng. p. 102.

A. Bootan. From Pemberton's Collection.

The following genus, having a nearer affinity to *Paradoxornis* and *Suthora*, than to *Crateropus* (vide p. 214), close to which it had previously been placed in this CATALOGUE, is now transferred to the present subfamily.

Genus Conostoma, Hodgs., J. A. S. Beng. X. p. 856 (1841). CONOSTOMA ŒMODIUM, Hodgson.

Conostoma æmodium, Hodgs., J. A. S. Beng. X. p. 857, t.

A. B. Nepal. Presented by B. H. Hodgson, Esq.

Genus Suthora, Hodgs., Ind. Rev. II. p. 32 (1838).

Temnoris, Hodgs., J. A. S. Beng. X. p. 29 (1841); XII. p. 449; P. Z. S. (1845), p. 31.

HEMIRHYNCHUS, Hodgs., P. Z. S. (1845), p. 31.

CHLEUASICUS, Blyth, J. A. S. Beng. XIV. p. 578 (1845).

### 613. SUTHORA NIPALENSIS, Hodgson.

Suthora nipalensis, Hodgs., Ind. Rev. II. p. 32; Cat. B.

of Nep. p. 73. G. R. Gray, Gen. of Birds, I.

p. 193. Blyth, J. A. S. Beng. XIV. p. 579; Cat.

B. Mus. A. S. Beng. p. 102. Bonap., C. G. Av.

p. 334. Gould, Birds of Asia, t. (upper figure).

Temnoris nipalensis, Hodgs., J. A. S. Beng. XII. p. 450.

Temnoris (Suthora) atrifrons, *Hodgs.*, *Gray's Zool. Misc.* (1844), p. 83.

Temnoris atrifrons, Hodgs., P. Z. S. (1845), p. 31.

Suthora, Nepal, Hodgson.

The Nepal Suthora, Gray.

A. b. Nepal (No. 470, Hodgs. Catal.). Presented by
 B. H. Hodgson, Esq.

S. nipalensis. "Crown of the head and back of the neck brownish grey; car-coverts and sides of the neck grey; face and superciliary stripes white, bounded above by a broad black line; chin transversely barred with black and rusty-red; upper and under surface rusty-red, fading into white on the centre of the abdomen; wings dark brown, the first two or three quills edged with white, the next two or three edged at the base with rufous, and the remainder edged throughout their entire length with the same colour, but of a deeper hue; tail dark brown, edged externally with rufous; bill black, bluish at the base; legs fleshy white."

Length  $4\frac{1}{4}$  in., of wing  $1\frac{1}{12}$  in., tail  $2\frac{1}{4}$  in., bill  $\frac{1}{4}$  in., tarse  $\frac{3}{4}$  in., central toe and nail  $\frac{1}{2}$  in., hind ditto  $\frac{3}{8}$  in. Weight  $\frac{1}{2}$  oz.

Mr. Hodgson remarks: "Sexes alike. Inhabits the central and northern regions of Nepal;" and adds: "Observed in the Cachâr in small flocks; frequenting brushwood and tall grass; manners and food of Parus."

# 614. SUTHORA FULVIFRONS, Hodgson.

Temnoris (Suthora) fulvifrons, Hodgs., Gray's Zool. Misc. (1844), p. 83.

Suthorn fulvifrons, Blyth, J. A. S. Beng. XIV. p. 579; Cat. B. Mus. A. S. Beng. p. 102. Bonap., C. G. Av. p. 334. Gould, Birds of Asia, t. 61.

Temnoris fulvifrons, Hodgs., P. Z. S. (1845), p. 31.

Temnoris nipalensis, apud Hodgs., J. A. S. Beng. XII. (figure to p. 450).

Suthora nipalensis, apud Hodgs., Cat. B. of Nep. p. 73. G. R. Gray, Gen. of Birds, I. p. 193.

The Fulvous-fronted Suthora.

A. Nepal (No. 684, 888, Hodgs. Cat.). Presented by B. H. Hodgson, Esq.

S. fulvifrons. "Upper parts light rufescent brown, inclining to fulvous on the forehead, throat, and breast, with a broad paledusky streak along each sinciput; secondaries and base of caudals broadly margined with bright chestnut fulvous; the belly and flanks albescent greyish; bill pale, dusky along the ridge of the upper mandible; legs light brown."

Length 5 in., of wing  $2\frac{1}{8}$  in., tail  $2\frac{1}{8}$  in., its outermost feathers  $1\frac{1}{4}$  in. less, bill to forehead  $\frac{1}{4}$  in., and tarse  $\frac{3}{4}$  in.

# 615. SUTHORA POLIOTIS, Blyth.

Suthora poliotis, *Blyth*, *J. A. S. Beng.* XX. *p.* 522 (1851).

Suthora nipalensis, apud Gould, Birds of Asia, t. (the two lower figures only).

A. B. c. d. Nepal (No. 918, Hodgs. Catal.\*). Presented by B. H. Hodgson, Esq., June, 1853.

S. poliotis. "Crown bright fulvous, passing to duller fulvous on the back; front and a broad streak over the eyes to the nape coalblack; lores and sides of face, with the plumes growing from the base of the lower mandible, pure white; car-coverts and a spot behind the eye below the black streak, bright fulvous; below the ear-coverts and sides of the neck pure ash; paler on the breast, and passing to white on the abdomen; chin and throat black with whitish

<sup>\*</sup> This has been given as a distinct species by Mr. Hodgson, and to which he has affixed the above number in his Catalogue.

margins; wings and tail coloured as in S. nipalensis, but of much brighter hues."

Length 41 in., of wing 2 in., tail 21 in., bill 1 in., and tarse 1 in.

The following are the descriptions of the other known species of this interesting genus.

#### SUTHORA WEBBIANA, G. R. Gray.

Suthora webbiana, G. R. Gray, Gen. of Birds P. Z. S. (1852), p. 70. Gould, Birds of Asia, t. 62.

HAR. Shanghai (China). In British Museum Collection.

S. webbiana. "Crown of the head and back of the neck sandy red, passing into the clive tint of the back and upper surface generally; tail of the same colour, but of a shade darker than the back; primaries strongly edged with bright rufous; throat and breast light buff, washed with a rosy tint; abdomen inclined to clive; bill light brown, washed with rosy pink; legs fleshy white."

Length about 54 in., of wing 23 in., tail 23 in., bill 4 in., and tarse 10 in.

#### SUTHORA RUFICEPS, Blyth.

Chleuasicus ruficeps, Blyth, J. A. S. Beng. XIV. p. 578.
Suthora ruficeps, Blyth, Cat. B. Mus. A. S. Beng. p. 102. Bonap.,
C. G. Ar. p. 334.

HAB. Sikim. In Mus. As. Soc. Bengal.

S. ruficeps. "Head and neck bright ferruginous; the rest of the upper parts olive brown, more or less inclining to ferruginous, especially towards the shoulder of the wing; the entire under parts white; bill whitish horn colour; legs greenish-plumbeous."

Length  $5\frac{1}{8}$  in., of wing  $2\frac{5}{8}$  in., tail  $2\frac{9}{1}$  in., bill to forehead  $\frac{9}{8}$  in., and tarse  $\frac{7}{8}$  in.

"The bill in this species is rather larger and decidedly broader than in the typical species of Suthora, and the outline of which (as seen laterally) is still more turnid and anomalous-looking. The legs, with the toes and claws, are thicker and stouter than in the other species."—(Blyth.)

# APPENDIX No. I.

Additional Species, received in the Museum during the printing of the Catalogue.

Genus Spizaetus, Vieill. (p. 32).

# 616. SPIZA ETUS NIPALENSIS, Hodgson, Sp.

Nisaëtus nipalensis, Crested var., Hodgs., J. A. S. Beng. V. p. 229 (1836); VI. p. 361; Beng. Sport. Mag. (1836), p. 33.

Spizaëtus nipalensis, Hodgs., Cat. B. of Nep., p. 41. Blyth, Cat. B. Mus. A. S. Beng. p. 24.

Nisaëtus pulchrior, *Hodgs.*, *Gray's Zool. Misc.* (1844), p. 81.

Nisaëtus pulcher, Hodgs., J. A. S. Beng. XII. p. 305.

Falco orientalis, Temm. et Schleg., Faun. Japon. t. 3?

Falco lauceolatus, Temm. et Schleg., Faun. Jap. p. 7?

a. Nepal (No. 786, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., June, 1853.

Genus Neopus, Hodgs., Gray's Zool. Misc. (1844), p. 81.

HETEROPUS, Hodgs., J. A. S. Beng. XI. p. 881 (1842).
 ICTINAËTUS, Jerdon (nec. Kaup), Madr. Journ. XIII.
 pt. 2, p. 117 (1844).

# 617. NEOPUS MALA YENSIS, Reinwardt Sp.

Falco malayonsis, Reinw., Temm. Pl. Col. 117.

Aquila malayensis, G. R. Gray, Gen. of Birds, I. p. 14;

Catal. Birds B. M. I. p. 13. Bonap., C. G. Av. p. 14.

Aquila malayana, Less., Tr. d'Orn. p. 39.

Ictinaëtus malayensis, Jerd., Madr. Journ. XIII. pt. 2, p. 117. Blyth, Cat. B. Mus. A. S. Beng. p. 218.

Onichaëtus malayensis, Kaup, Class. der Sæug. und Væg. (1844), p. 120.

Neopus malayensis, Hodgs., Cat. Birds of Nep. p. 42.

Aquila pernigra, Hodgs., J. A. S. Beng. V. p. 227 (1836); Beng. Sport. Mag. (1836), p. 32.

Neopus perniger, Hodgs., Gray's Zool. Misc. (1844), p. 81.

Nisaëtus ovivorus, Jerd., Madr. Journ. XIII. pt. 1, p. 158 (1844).

Reinwardt's Black Eagle.

a. Nepal (Neopus perniger, Hodgs.). Presented by B.
 H. Hodgson, Esq., June, 1853.

"This is a shy bird, which adheres exclusively to the wild and mountainous tracts of the Hills. Its body is entirely free from offensive odour and vermin, and its prey chiefly the pheasants of the region it frequents, as well as their eggs. Its weight is about  $4\frac{1}{2}$  lbs."—(Hodgson.)

"This bird hunts about the edges of the hills more generally than on the higher parts of the table-land, and most frequently over bushy ground, though I have also seen it over forest, both on the tops of the hills, and halfway down the Coonoor Ghaut. It sails slowly along with very little motion of its wings, usually very close to the ground, hunting tolerably regularly, not unlike the Harriers, and like them hardly ever alights except for the purpose of feeding. In three specimens I have examined, I found that eggs and nestlings had formed its only food. Among these I recognized the eggs of the Hill-Quail (Coturnix crythrorhyncha), of the Malacocercus Somervillei, and of some doves (Tutur tigrina and T. cambayensis), besides others I did not know, and several nestlings. I have seen it since I procured my specimens alight for a few seconds on a large bush over which it had been circling for some time, and apparently devour something. I found in this bush a dove's nest empty, which it had evidently robbed. This eagle thus appears to be a robber of bird's nests, and as doves, as well as some other birds,

breed throughout the whole year, it can probably sustain itself mostly on its favourite food, though it doubtless occasionally destroys young, feeble, or sickly birds, and perhaps reptiles."—(Jerdon.)

#### Subfam. BUTEONINÆ.

Genus Archibuteo, Brehm., Isis (1828), p. 1269.

TRIORCHIS, Kaup, Naturl. Syst. der Eur. Thierw. p. 84 (1829),

Butaëtes, Less., Tr. d'Orn. p. 83 (1831).

BUTAQUILA, Hodgs., Gray's Zool. Misc. (1844), p. 81.

Hemiaetus, Hodgs., Gray's Zool. Misc. (1844), p. 81.

#### 618. ARCHIBUTEO HEMIPTILOPUS, Blyth.

Archibuteo hemiptilopus, Blyth, J. A. S. Beng. XV. p. 1 (1846); Cat. B. Mus. A. S. Beng. p. 28. G. R. Gray, Gen. of Birds, I. p. 12. Bonap., C. G. Av. p. 18.

Archibuteo cryptogenys, Hodgs., Calc. Journ. (1847), p. 96.

A. Tibet (No. 935, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

#### Fam. MEROPIDÆ.

Genus Nyctiornis, Swains. (p. 89).

# 619. NYCTIORNIS AMICTA, Temminck Sp.

Merops amictus, Temm., Pl. Col. 310.

Nyctiornis amicta, Swains., Zool. Ill. 2nd ser. t. 56. G.

R. Gray, Gen. of Birds, I. p. 87; Cat. B. Brit. Mus. II. p. 72. Gould, Birds of Asia, t. Bonap., C. G. Av. p. 164.

Alcemerops amicta, Blyth, Cat. B. Mus. A. S. Beng. p. 52.

The Red-throated Nyctiornis, Gould.

KAY CHUA, Malay, Eyton.

A. Malacca. Presented by John Gould, Esq., December, 1853.

b. c. d. Malacca. Presented by Dr. Cantor, April, 1854.

#### Fam. HIRUNDINIDÆ.

#### Subfam. HIRUNDININA.

Genus HIRUNDO, Linn. (p. 91).

620. IIIRUNDO DOMICOLA, Jerdon.

Hirundo domicola, Jerd., Madr. Journ. XIII. p. 173 (1844). Blyth, Cat. B. Mus. A. S. Beng. p. 198.

Hirundo javanica, apud Shaw, Zool. X. p. 101. Lath., Hist. VII. p. 300.

Bungalow Swallow, of Residents in the Neilgherries, Jerdon.

A. B. c. d e. f. Pinang. Presented by Dr. Cantor, April, 1854.

"This curiously-plumaged little swallow is by no means rare on the Neilgherries, and builds in retired or deserted bungalows, outhouses, &c., making a small mud nest, quite open at the top, and profusely lined with feathers."—(Jerdon.)

Genus Deliciion, (Hodgs.) Moore, P. Z. S. (1854), p.

621. DELICHON NIPALENSIS, Hodgson.\*

Delichon nipalensis, (Hodgs.) Moore, P. Z. S. (1854), p. The Nepal Martin.

A. B. Nepal (No. 963, Hodgs. Catal.). Presented by B.H. Hodgson, Esq., September, 1853.

Gen. char. Bill short, thick, robust; gape rather wide; the culmen rounded; the nostrils basal, lateral, rounded; wings rather long, with the first quill the longest; tail short and emarginated, or nearly even at the end; tarsi longer than the middle toe, and clothed with plumes; toes long, and clothed with plumes, the inner shorter than the outer; the claws moderate and curved.

Spec. char. Top of the head, chin, cheeks, ear-coverts, nape, back,

<sup>\*</sup> In the Leyden Museum there is a bird from Borneo allied to but distinct from this, to which M. Temminck has applied the name of *Hirundo dasypus*, and which is placed in Bonaparte's "Consp. Gen. Av." p. 343, under the genus *Chelidon*, with the following remarks: "Media quasi inter *Cotyles* et *Chelidonem*, cujus autem altera species; pedibus dense plumosis: minor; cauda multo breviore, minus emarginata: coloribus similibus, subtus autem sordidior, collari adumbrato,"

upper and under tail-coverts, fine glossy black; wings black, paler beneath, the upper coverts margined with glossy black, the lower wing-coverts dusky black; tail black, fringed externally with glossy black; a band of white across the rump; throat, breast, abdomen, hind parts of flanks, and vent, pure white; fore part of flanks black; tarsi and toes covered with white plumes; claws pale fleshy; bill black. Length from the tip of the bill to the end of the tail  $3\frac{3}{4}$  in., of wing  $3\frac{5}{6}$  in., of tail  $1\frac{5}{8}$  in., bill to front  $\frac{3}{16}$  in., to gape  $\frac{7}{16}$  in.; height from chin to front  $\frac{1}{8}$  in.; breadth at front  $\frac{3}{20}$  in.; tarse  $\frac{7}{16}$  in.; middle toe and claw  $\frac{9}{20}$  in.; hind ditto  $\frac{7}{20}$  in.

This interesting bird differs from the type of the genus *Chelidon* by its smaller and more robust bill, and by its short and nearly even tail, the wings also being shorter; from *Cotyle* it is at once distinguished by its plumed feet.

Genus Chelidon, Boie, Isis (1822), p. 550.

### 622. CHELIDON URBICA, Linn. Sp.

Hirundo urbica, Linn., S. N. I. p. 344. Lath., Hist. VII. p. 283. Blyth, Cat. B. Mus. A. S. Beng. p. 31.

Chelidon urbica, Boie, Isis (1822), p. 550. G. R. Gray, Gen. of Birds, I. p. ; Cat. B. Brit. Mus. pt. 2, p. 31. Bonap., C. G. Av. p. 343.

Hirundo lagopoda, Pallas, Zoogr., I. p. 532.

Chelidon rupestris et C. fenestrarum, Brehm., Væg. Deutschl. I. p. 140.

The Common Martin, Lath.

HAB. Europe, N. Asia, Africa; rare in S. India.

a. England. Presented by John Gould, Esq.

#### Subfam. CYPSELINA.

Genus Cypselus, *Illiger* (p. 106).

# 623. CYPSELUS VITTATUS, Jardine et Selby.

Cypselus vittatus, Jard. et Selby, Ill. Orn. 2nd ser. t. 39. G. R. Gray, Gen. of Birds, I. p. 54. Blyth, Cat. B. Mus. A. S. Beng. p. 85. Bonap., C. G. Av. p. 65. Cypselus australis, apud Blyth, J. A. S. Beng. XI. p. 886.

A. Pinang. Presented by Dr. Cantor, April, 1854.

# 624. CYPSELUS SUBFURCATUS, Blyth.

Cypselus subfurcatus, Blyth, J. A. S. Beng. XVIII. p. 807 (1849); Cat. B. Mus. A. S. Beng. p. 85. Bonap., C. G. Av. p. 65.

Cypselus affinis, apud Strickland, P. Z. S. (1846), p. 99.

A. B. c. d. Pinang. Presented by Dr. Cantor, April, 1854.

"The nidification of this bird is remarkably different from Cypselus affinis; several pairs inhabiting a continuous common nest, which is affixed to an eave in the manner of that of Hirundo urbica, or of Cup. affinis; the latter species, however (so far as we have observed), so placing its nest as to be concealed, or at least rendered inconspicuous by a rafter or other object in front. According to the following account by Colonel Low, 'a colony of C. subfurcatus inhabited the verandah of a house in the island of Pinang. They began with a pair, and now compose a harmonious family of about sixteen or eighteen. The nests are fastened to the beam much in the same way as the nest of the swallow, but their nidificatory habits differ from those of the latter birds by their running two, three, or more nests into one. There were about six or eight birds in the specimen of a nest herewith sent, which had three apertures. They seem to keep a regular watch at night, for, on the least noise, the sentinel pipes a little, and is then followed by all the rest. They lay two eggs; and are not migratory,—at least, my friends are not for they have been domiciled upwards of a year where they are now." "The nest above noticed is a beautiful fabric in its way, remarkably light and compact, being composed of feathers and other light substances firmly bound together by a good deal of the saliva-like gluten, several shed primaries and other feathers of the birds themselves, doubtless cast within the nest, are thus fastened in to add to the lining. The only aperture visible, now that the nest has been cut away from its place of attachment, is a somewhat prolonged entrance at one extremity; and there appear to be but two depressions adapted for the reception of eggs, which renders it probable that several of its inhabitants were the young of a former brood, or perhaps broods. The total length of the interior is 12 in. by nearly 5 in., where broadest, and this capacity would indicate that it is intended as much for a habitation for a number of the birds, as for the ordinary purpose of incubation. Procuring some nests of Cyp. affinis for comparison, the size of these also indicates the fact that they are similarly inhabited, but it would appear that there is no

convenience in them for more than one pair of birds to incubate. They consist of a much thicker and heavier mass of material than the nest of *C. subfurcatus*; but where two are built in contact, the wall of separation is thin, though we suspect it will be always found intact and completely separated. During the night, *C. affinis* is equally vigilant with its Malayan representative. The latter would appear to be the common house Swift of the Malayan peninsula, taking the place of *C. affinis* of India; while *C. vittatus* would seem to be exclusively a mountain species, which is common at Pinang, and which has been obtained by Captain Hutton from the Tyne range of mountains near Simla, and *C. leuconyx* may be the representative of the last on the mountains of S. India."—(Blyth.)

Genus Acanthylis, Boie (p. 111).

625. ACANTHYLIS GIGANTEUS, Temminck Sp.

Cypselus giganteus, Temm., Pl. Col. 364.

Acanthylis giganteus, G. R. Gray, Gen. of Birds, I. p. 55. Bonap., C. G. Av. p. 64.

Acanthylis caudacuta, apud Blyth, Cat. B. Mus. A. S. Beng. p. 84.

A. Pinang. Presented by Dr. Cantor, April, 1854.

#### Fam. CAPRIMULGIDÆ.

Genus Batrachostomus, Gould (p. 112).

626. BATRACHOSTOMUS AURITUS, Vigors Sp.

Podargus auritus, Vigors, Griffith's Transl. of Cuv. An. Kingd. II. t. p. 114; App. to Mem. of Sir T. S. Raffles, p. 653. Blyth, Cat. B. Mus. A. S. Beng. p. 81.

Batrachostomus auritus, Gould, Icones Avium, p., t. 7. G. R. Gray, Cat. Birds in B. M. II. p. 3; Gen. of Birds, I. p. 45. Bonap., C. G. Av. p. 57.

Bombycistomus Fullertonii, Hay, J. A. S. Beng. X. p. 574 (1841).

Podargus Fullertonii, Blyth, J. A. S. Beng. XI. p. 798. The Great-eared Goat-sucker, Gray.

A. b. Malacca. Presented by Dr. Cantor, April, 1854.

# 627. BATRACHOSTOMUS STELLATUS, Gould Sp.

Podargus stellatus, Gould, P. Z. S. (1837), p. 43.

Batrachostomus stellatus, G. R. Gray, Gen. of Birds, I. p. 45; Cat. Birds in Brit. Mus. II. p. 3.

Podargus crinifrons, Temm., Mus. Lugd. Bonap., C. G. Av. p. 57.

A. b. c. d. Malacca. Presented by Dr. Cantor, April, 1854.

Genus Lyncornis, Gould, Icones Avium (1838).

# 628. LYNCORNIS TEMMINCKI, Gould.

Lyncornis Temminckii, Gould, Icones Avium, t. 6. Bonap., C. G. Av. p. 62.

Eurostopodus Temminckii, G. R. Gray, Gen. of Birds, I. p. 50; Cat. Birds Brit. Mus. II. p. 12. Blyth, Cat. B. Mus. A. S. Beng. p. 82.

Caprimulgus pulcher, Hay, Madr. Journ. XIII. pt. 2, p. 161 (1844).

Caprimulgus imberbis, Temminck, MSS.

A. b. c. Pinang. Presented by Dr. Cantor, April, 1854.

Genus Caprimulgus, Linn. (p. 112).

# 629. CAPRIMULGUS ALBONOTATUS, Tickell.

Caprimulgus albonotatus, Tickell, J. A. S. Beng. II. p. 580; XVII. pt. 1, p. 301. G. R. Gray, Cat. Birds Brit. Mus. II. p. 8. Hutton, J. A. S. Beng. XVII. pt. 2, p. 5. Blyth, Cat. B. Mus. A. S. Beng. p. 83. Bonap., C. G. Av. p. 60.

Caprimulgus gangeticus, Blyth, Ann. Nat. Hist. (1843), p. 95.

Caprimulgus macrourus, apud Blyth, J. A. S. Beng. XI. p. 586.

Caprinulgus nipalensis, Hodgs., Gray's Zool. Misc. (1844), p. 82; Catal. Birds of Nepal, p. 53.

The Nepal Goatsucker, Gray.

The Jungle Goatsucker, Tickell.

CHUPPA, Hind., Tickell.

A. b. c. d. Nepal (C. nipalensis, Hodgs.). Presented by B. H. Hodgson, Esq., June, 1853.

e. f. Assam. From McClelland's Collection.

g. h. i. Kumaon. From Captain R. Strachey's Collection.

"This is extremely common in the jungles, keeping in thickets during the day, and coming out to the open parts as evening sets in, grass plains, and khéts, which it skims over with a low silent flight. When on the wing, it emits a low chirp, somewhat like a sparrow; it has another and very peculiar note, when seated on the top of some decayed tree, and which, on a calm night, may be heard for a mile, sounding as if some one was striking a plank with a hammer deliberately."

"Makes no nest; eggs laid on the bare ground, in bush jungle, in general two; shape blunt, and both ends nearly equal; male egg  $\mathbf{1}_{3^{7}z} \times \frac{15}{16}$  in., pale fleshy clay-colour, sprinkled with patches of darker brownish-red; female egg  $\mathbf{1}_{30} \times \frac{7}{8}$  in., paler and redder."—(Tickell.)

"Of this species," remarks Captain Hutton, "which is a summer visitant at Mussooree, I took two eggs at an elevation of 5,000 feet, on the 19th April, from the bare ground, beneath bushes on the side of a hill, the colour being a rich cream white, with darker blotches of reddish brown or clay-colour. Of one, the diameter was  $1\frac{1}{4} \times \frac{7}{6}$  in., the other was somewhat smaller."

# Fam. TODIDÆ.

Genus Ampelis, Linn., S. N. (1735).

Bombycilla, (Briss.) Vieill., Ois. de l'Amér. Sept., (1807).

Bombyciphora, Meyer, Taschenb. (1810).

Bombycivora, Temm., Man. d'Orn. p. 76 (1815).

# 630. AMPELIS GARRULUS, Linn.

Ampelis garrulus, Linn., S. N. I. p. 297. G. R. Gray, Gen. of Birds, I. p. 278; Catal. Brit. Birds in B. M. p. 86. Blyth, Cat. B. Mus. A. S. Beng. p. 194. Bonap., C. G. Av. p. 336.

Bombycilla bohemica, Brisson.

Bombyciphora polioccelia, Meyer.

Bombycivora garrula, Temminck.
Parus bombycilla, Pallas, Zoogr. I. p. 548.
The Bohemian Waxwing, Selby.

a. Europe. Presented by John Gould, Esq.

Genus Cochoa, Hodgs., Journ. A. S. Beng. V. p. 358 (1836).
Prosorinia, Hodgs., Journ. A. S. Beng. X. p. 28 (1841).
Oreas, Temm., Text de Pl. Col. 274.

631. COCHOA PURPUREA, Hodgson.

Cochoa purpurea, Hodgs., Journ. A. S. Beng. V. p. 359; XII. p. 450 (with plate); Cat. B. Nep. p. 96. Blyth, Journ. A. S. Beng. XI. p. 182; XV. p. 313; Cat. B. Mus. A. S. Beng. p. 195. G. R. Gray, Gen. of Birds, I. p. 280. Bonap., C. G. Av. p. 350. Gould, Birds of Asia, t.

The Purple Cochon, Hodgs.

Сосно, Nepal, Hodgs.

A. B. & Q. Darjeeling. From Pearson's Collection. c. d. & Q. Nepal. Presented by B. H. Hodgson, Esq.

Mr. Hodgson remarks: "Like most of the Nepalese Thrushes, these birds are common to all the three regions of the kingdom. They are shy in their manners, adhere exclusively to the woods, live solitarily or in pairs, breed and moult but once a year, nidificate on trees, and feed almost equally on the ground and on trees. I have taken from their stomachs several sorts of stony berries, small univalve mollusca, and sundry kinds of aquatic insects."—(Journ. A. S. Beng. V. p. 358.)

# Fam. HALCYONIDÆ.

Genus Todiramphus, Lesson (p. 128).

632. TODIRAMPHUS VARIUS, Eyton Sp.

Haleyon varia, Eyton, P. Z. S. (1839), p. 101. G. R. Gray, Gen. of Birds, I. p. 79.

Todiramphus varius, Blyth, J. A. S. Beng. XV. p. 11; XVI. p. 1181; Cat. B. Mus. A. S. Beng. p. 47. Bonap., C. G. Av. p. 156.

A. b. Malacca. Presented by Dr. Cantor, April, 1854.

"Cap green, rufescent on forehead, and margined posteriorly with verditer; a broad black stripe commences at the lores and meets its opposite behind; above this is a slight rufous supercilium, and below it a broad rufous streak continued to the nape, and comprising the lower ear-coverts; below this again, is a very large rich purplish blue moustache, commencing at the base of the lower mandible; the nape and breast are brilliant ferruginous, paling on the throat and belly; and the mantle, wings, and tail are deep purplish-blue, each feather touched with ultramarine-blue on the wings, while the rump and upper tail coverts are vivid verditer; bordering the ferruginous of the nape, is a band of deep black; bill dusky above, the rest apparently bright yellow; and legs probably coral-red. Adult male (and perhaps the adult of either sex)."

"The young have the mantle and wings dark green, with a terminal pale fulvous spot on each feather, imparting a pretty speckled appearance."—(Blyth.)

Genus Ceyx, Lacep. (p. 132).

# 633. CEYX TRIDACTYLA, Linn. Sp.

 H. Hodgson, Esq., September, 1853.

B. c. d. Pinang. Presented by Dr. Cantor, April, 1854.

#### Fam. MUSCICAPIDÆ.

Genus Tchitrea, Lesson (p. 133).

634. TCHITREA INCEI, Gould Sp.

Muscipeta Incei, Gould, P. Z. S. (1852), p. ; Birds of Asia, t. (1852).

Ince's Paradise Flycatcher, Gould.

A. Shanghai (China). Presented by John Gould, Esq., 1853.

"In the male, the head, throat, and crest is very deep glossy steel-green; upper surface, wings, and tail very deep chestnut; primaries and secondaries black, margined with deep chestnut on their outer webs; chest dark grey; abdomen and under tail-coverts greyish white; bill blue. In the young bird, the head and neck are dull black; back and wings deep chestnut; wings brownish black, margined with pale chestnut; tail brown; breast and flanks sooty; middle of the abdomen and vent dull white.

This species is intermediate in colour between *Tch. paradisi* and *Tch. principalis* of Japan; it partakes of the characters of both, but is quite distinct from either; from the former, it differs in the broader, rounder, and shorter plumes of the crest, and in the dark chestnut colouring of the upper surface; and from the Japanese bird in the dark colouring of the throat not extending on to the flanks, in the upper surface not being of so rich a plum-colour, and in the tail being chestnut instead of black."—(Gould.)

Genus Philentoma, Eyton, Ann. Nat. Hist. (1845), p. 228.

Drymophila,\* Temm., Text de Pl. Col. 334 (1838).

Genus LALAGE, Boie (p. 175).

#### 641. LALAGE CULMINATUS, A. Hay.

Ceblepyris culminatus, A. Hay, Madr. Journ. XIII. p. 157 (1844).

# A. Q. Malacca. Presented by W. Griffith, Esq.

This female is readily distinguished from the same sex of L orientalis by the absence of the large white tips to the lesser and greater wing-coverts. The specimen examined has the head, neck, back, and upper tail-coverts of a greyish-cyaneous, each feather being marked at the point with a black bar, and then tipped with white; ear-coverts marked longitudinally with white; wings black; shoulders cyaneous; greater coverts slightly tipped with white, and the primaries and secondaries slightly fringed with the same; tail black, tipped with white; under-parts greyish white, each feather having two blackish bars across; under tail-coverts whitish; bill broader than in L orientalis, blackish; feet the same. Length  $6\frac{1}{2}$  in., of wing  $3\frac{1}{10}$  in., tail 3 in.

A. B. c. d. 3 9. Nepal (No. 589, 885, Hodgs. Catal.).

Presented by B. H. Hodgson, Esq., Sept. 1853.

B. cruralis. Male, colour above a deep cyaneous, or dark greyish-blue, paler on the belly, and relieved by a white superciliary streak confined to the base of the feathers, and yet showing conspicuously. Female, olivaceous-brown above; forehead, lores, and throat ferruginous, paler or dusky ferruginous beneath; wings and tail ferruginous-brown; bill black; legs brownish dusky. Length  $5\frac{1}{4}$  in., of wing  $2\frac{\pi}{8}$  in., tail  $1\frac{3}{4}$  in., bill to front (through the feathers)  $\frac{\pi}{8}$  in., and typically formed, tarse  $1\frac{1}{4}$  in.

# 647. BRACHYPTERYX NIPALENSIS, Hodgson.

Brachypteryx nipalensis, (Hodgs.) Moore, P. Z. S. (1854), p.

- A. B. c. d. & Q. Nepal (No. 943, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., Sept., 1853.
- B. nipalensis. Male, colour above a greyish cyaneous, or light greyish blue, as are also the cheeks, sides of breast, and flanks, and paling to greyish white on the middle of the breast; throat, middle of belly, vent, and under tail-coverts, a streak over, but not extending beyond the eye, white. Female, ferruginous-brown above, paler on

the sides; throat, breast, belly, under tail-coverts, and superciliary streak whitish; the feathers on the breast and sides fringed with brown; bill dark horn; legs paler. Length  $4\frac{1}{4}$  in., of wing  $2\frac{1}{2}$  in., tail  $1\frac{3}{8}$  in., bill to gape  $\frac{6}{8}$  in., and tarse 1 in.

Genus Pnoëpyga, Hodgs. (p. 180).

# 648. PNOËPYGA LONGICA UDATA, Moore.

Pnoëpyga longicaudata, Moore, P. Z. S. (1854), p.

A. Afghanistan. From Griflith's Collection.

P. longicaudata. Colour of the upper parts deep olive-brown, the feathers slightly margined with black, and having blackish shafts; wings and tail inclined to ferruginous-brown; upper tail-coverts long; throat whitish; breast and sides of abdomen pale dusky ferruginous, the feathers having pale centres and blackish margins; middle of lower part of breast and abdomen white; flanks the same as the back; vent and under tail-coverts dark ferruginous; bill dark brown, legs paler. Length  $4\frac{1}{2}$  in., of wing 2 in., the tail is rounded, the central feathers being  $2\frac{1}{4}$  in. long, and the outer  $1\frac{1}{2}$  in., bill to front (through the feathers)  $\frac{1}{2}$  in., to gape  $\frac{6}{10}$  in., and tarse  $\frac{1}{10}$  in.

Turdus micropus, Hodgs., Cat. Birds of Nep. p. 80. Ward's Blackbird.

A. J. S. India. Presented by John Gould, Esq., 1853.

M. Wardii. "Male black, with white eye-streak and under-parts from the breast, except the feathers of the flanks, which are only margined with white; and, besides a white wing-patch under the scapularies, the wing-coverts and tertiaries are tipped with the same, and the secondaries and middle tail-feathers, with the upper tail-coverts, more slightly, the rest of the tail-feathers being successively more deeply so tipped, increasing in amount to the outermost. The female has the upper parts brown instead of black, with slight whitish tips to the upper tail-coverts, and less white on the tail-feathers, which is also less pure; the wing-coverts are each tipped with a triangular spot of fulvous-white, and the tertiaries more slightly; the supercilium is also fulvous-white, and the entire under-

parts, except the lower tail-coverts, which are purer white, a little variegated with dusky; while the feathers of the throat, breast, and flanks are each tipped with a transverse dusky spot, more or less triangular on those of the breast; axillaries chiefly pure white; bill and legs yellowish. Length 9 in., of wing  $4\frac{1}{10}$  in., tail  $3\frac{5}{8}$  in., bill to front  $\frac{3}{4}$  in., to gape  $1\frac{1}{10}$  in., and tarse  $1\frac{1}{10}$  in."

Genus Trochalopteron, Hodgs. (p. 210).

SHAH DUMRI, Hind., Jerdon.

Pundi Jitta (i. e. 'Pig-Bird'), Telugu, Jerdon.

- A. S. India. Presented by the Asiatic Society of Bengal.
- B. Madras. Presented by John Gould, Esq., 1853.

"This bird," remarks Mr. Jerdon, "I have seen but very seldom; once at the top of the Tapoor pass in thick jungle, and in the

neighbourhood of Jaulnah, in jungly district, in thick hedges, and thick wooded nullahs. From the dense nature of the bushes it frequents, it is with difficulty observed and obtained. I have generally seen it in parties of five or six, occasionally giving out a low and indistinct sort of chattering. Fragments of various insects were found in the stomachs of those I procured. It is called *Pundijitta*, or Pig Bird, in Telugu; a name given from its habits of making its way under the bushes, never showing itself above."

Mr. Blyth states: "Its note considerably resembles that of Malacocereus candatus, except in being proportionally weaker."

"In Ceylon, it is confined to the vicinity of Colombo, and is not uncommon; it is generally found in small flocks about the cinnamon and other low bushes, creeping about in search of insects."—(Layard.)

### 661. TRICHLYOS PYRRHOPYGA, Lesson.

Trichixos pyrrhopyga, Lesson, Rev. Zool. (1839), p. 167. Blyth, Cat. B. Mus. A. S. Beng. App. p. xx.

Turdirostris supereiliaris, A. Hay, Madr. Journ. XIII. pt. 2, p. 163 (1844). Blyth, Cat. B. Mus. A. S. Beng. p. 145. Bonap., C. G. Av. p. 217.

Macronus superciliaris, G. R. Gray, Gen. of Birds, 111. App. p. 9.

Napothera pyrrhomelanura, Müller.

A. J. Malacca. Presented by W. Griffith, Esq.

C. d. ? or jun. Malacca. Presented by Dr. Cantor, 1854.

T. pyrrhopyga. Male, colour of the head, nape, back, chin, throat, breast, and shoulders ashy black, deepest above; a white superciliary stripe above, but not beyond, the eye; rump, upper tail-coverts, and tail bright rufous, the latter tipped with a broad deep brown-black band; wings brown, margined with ashy; flanks and under tail-coverts rufous; belly and vent whitish, washed with rufous; bill black; legs pale yellow. Length  $8\frac{1}{2}$  in., of wing 4 in., tail 4 in. (its outermost feathers shorter), bill to front (through the feathers)  $1\frac{1}{10}$  in., to gape  $1\frac{2}{8}$  in., tarse  $1\frac{1}{10}$  in. In the young, or female, the plumage above is brown mixed with rufous; the forehead, round the eyes, chin, throat, breast, flanks, and under tail-coverts dusky-

rufous, whitish on the middle of the belly and vent; the wings brown, the coverts tipped with rufous; the bill is rather shorter and thicker, and is of a horny colour above, yellowish below at base.

Genus Trichastoma, Blyth ( p. 226).

# 662. TRICHASTOMA ABBOTTI, Blyth.

Malacocinela Abbotti, Blyth, J. A. S. Beng. XIV. p. 601 (1845).

Trichastoma Abbotti, *Blyth*, *J. A. S. Beng.* XVI. p. 462; *Cat. Birds Mus. A. S. Beng.* p. 147. *Bonap.*, *C. G. Av.* p. 259. *Moore*, *P. Z. S.* (1854), p.

Malacopteron Abbotti, G. R. Gray, Gen. of Birds, III.

App. p. 9.

A. Nepal (No. 919, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

B. c. d. Dacca. Presented by Captain R. C. Tytler, 1854.

T. Abbotti. Colour above, plain olive-brown, tinged with rufous on the rump and tail; the upper tail-coverts ferruginous brown, under-parts paler; the throat and middle of the belly white; the car-coverts, sides of the breast, and flanks rufescent; the lower tail-coverts pale ferruginous; bill horn-colour, paler beneath. Length 6 in., of wing 3 in., tail  $2\frac{1}{8}$  in., bill to gape  $\frac{1}{4}\frac{1}{2}$  in., and tarse the same.

# 663. TRICHASTOMA ROSTRATUM, Blyth.

Trichastoma rostratum, Blyth, J. A. S. Beng. XI. p. 795 (1842); XIII. p. 383; XVI. p. 462; Cat. Birds Mus. A. S. Beng. p. 147. Bonap., C. G. Av. p. 259.

Malacopteron rostratum, G. R. Gray, Gen. of Birds, I. p. 209.

A. B. c. Malacca. Presented by Dr. Cantor, April, 1854.

T. rostratum. Colour of the upper parts uniform olive-brown, somewhat darker on the erown, and having a slight ruddy tinge on the rump and tail; the whole under-parts pure white, a little sullied on the breast and lower tail-coverts; lores and sides of the head pale fulvescent brown, and sides of the neck to the breast ashy; upper mandible horny black; lower yellowish white, except at its extreme tip; legs deeply tinged with yellowish brown. Length about 6 in.,

of wing  $2\frac{3}{4}$  in., tail 2 in., its outermost feather  $\frac{3}{8}$  in. shorter; bill to forehead (through the feathers)  $\frac{3}{4}$  in., to gape  $\frac{15}{16}$  in., tarse  $\frac{15}{16}$  in.

Genus Alcippe, Blyth (p. 226).

# 664. ALCIPPE CINEREA, Eyton Sp.

Malacopteron cinereum, Eyton, P. Z. S. (1839), p. 103. G. R. Gray, Gen. of Birds, I. p. 209.

Alcippe cinerea, Blyth, J. A. S. Beng. XIII. p. 384; XVI. p. 462; Cat. Birds Mus. A. S. Beng. p. 148. Bonap., C. G. Av. p. 260.

A. B.c. Malacca. d. Pinang. Presented by Dr. Cantor, 1854.

"Irides grey; bill blackish; feet reddish grey, soles dirty orange. Food seeds and insects."—(Cantor's Notes.)

### 665. ALCIPPE AFFINIS, Blyth.

Trichastoma affine, Blyth, J. A. S. Beng. XI. p. 795 (1842).

Alcippe affinis, Blyth, J. A. S. Beng. XIII. p. 384; XVI. p. 462; Cat. Birds Mus. A. S. Beng. p. 148. Bonap., C. G. Av. p. 359.

Malacopteron affine, G. R. Gray, Gen. of Birds, I. p. 209.

Napothera atricapilla, Müller, Mus. Lugd. Bonap., C. G. Av. p. 359.

BURONG NIPA, Malay, Cantor.

A. Malacca. Presented by W. Griffith, Esq.

B. Malacca. Presented by Dr. Cantor, 1854.

"Distinguished by its dark crown, pale nape, rufescent hue of the back and rump, and deep ferruginous tail-feathers; white underparts, and having a distinct brownish-grey band crossing the breast. Length  $5\frac{3}{4}$  in., of wing  $2\frac{3}{8}$  in., tail  $2\frac{1}{2}$  in., its outermost feather  $\frac{3}{8}$  in. shorter; bill to forehead, through the feathers,  $\frac{5}{8}$  in., to gape  $\frac{1.9}{1.6}$  in., and tarse  $\frac{3}{4}$  in."

# 666. ALCIPPE CANTORI, Moore.

Alcippe Cantori, Moore, P. Z. S. (1854), p.

A. Pinang. Presented by Dr. Cantor, 1854.

A. Cantori. Upper parts olive-brown, tinged with rufous on the rump; crown ash-brown, being much lighter than in A. affinis; nape

paler; lores, a streak over and behind the eyes, with the ear-coverts, ashy white; throat, belly, vent, and under tail-coverts white; breast mingled white and ash; wings rufescent brown, the remiges margined brighter; upper tail-coverts and tail deep rufo-ferruginous, darker towards the tip; bill horny above, pale below; feet greenish. Length nearly  $7\frac{1}{2}$  in., of wing 3 in., tail  $3\frac{1}{8}$  in., bill to frontal plumes  $\frac{1}{2}$  in., to gape  $\frac{3}{4}$  in., and tarse  $\frac{10}{12}$  in.

Distinguished from A. affinis and A. albogularis by its larger size, longer wings and tail.

# 667. ALCIPPE MAGNIROSTRIS, Moore.

Alcippe magnirostris, Moore, P. Z. S. (1854), p.

A. Malacca. Presented by Dr. Cantor, 1854.

A. magnirostris. Upper parts olive-brown, darkest on the crown, palest on the nape, and tinged with rufous on the rump; the feathers of the crown spatulate, and have a perceptibly darker shaft and margin; lores and streak over, but not beyond, the eye whitish; base of lower mandible, down the sides of the throat, with the tips of some of the feathers of the cheek, dark ash; throat, belly, vent, and under tail-coverts white; sides of the breast ashy-olive, the middle more ashy; wings rufescent brown; upper tail-coverts and tail deep rufo-ferruginous; bill horny above, paler below; feet greenish. Length 6 in., of wing 3 in., tail  $2\frac{3}{4}$  in., bill to frontal plumes  $\frac{1}{10}$  in., to gape  $\frac{0}{10}$  in., tarse  $\frac{1}{12}$  in.

May be known from the other described species by its longer and more robust bill, and by the dark ash streak down the sides of the throat.

# 668. ALCIPPE STRIATA, Blyth.

Timalia striata, Blyth, J. A. S. Beng. XI. p. 793 (1842).
Alcippe striata, Blyth, Cat. Birds Mus. A. S. Beng. p. 149. Bonap., C. G. Av. p. 260.

Macronus striatus, G. R. Gray, Gen. of Birds, I. p. 210. ? Myiothera epilepidota, Temm., Pl. Col. 448, f. 2.

A. B. c. Malacca. Presented by Dr. Cantor, 1854.

A. striata. "Head and neck above black, or rather brown-black; the feathers of the mesial line white about the shaft, forming a streak of this colour along the middle of the head, besides which are two slight lateral streaks not observable in every specimen, in addition to a superciliary line of the same; on the nape, the white centres of the feathers broader, and are more irregularly disposed, while on the

408 CATALOGUE.

back they become much narrower again, more or less so in different specimens, and wholly disappear on the rump; the ground hue of the back and rump is rich fulvous brown, brightening on the latter, and tending to rufous on the upper tail-coverts; lores conspicuously pale fulvous, and the throat and foreneck fulvous white, the ear-coverts margined with black; sides of the breast white, handsomely bordered with black, and a very slight margin of the same to the medial pectoral feathers; rest of the under-parts white, the flanks bordered with fulvous brown, which spreads nearly over the whole feather posteriorly; lower tail-coverts more or less tinged with the same; wing-feathers dusky interiorly, the coverts having terminal longitudinal white spots; tail ruddy brown, margined with more rufous brown at base; bill black; legs yellowish. Length  $5\frac{1}{2}$  in., of wing  $2\frac{1}{2}$  to  $2\frac{5}{8}$  in., tail 2 in., bill to forehead (through the feathers)  $\frac{5}{8}$  in., to gape  $\frac{7}{8}$  in., and tarse  $\frac{3}{4}$  in."

Genus Pyctorhis, *Hodgs.*\* (1844), (p. 230). Chrysomma, *Hodgs.* (1845).

669. PYCTORHIS LONGIROSTRIS, Hodgson.

Pyetorhis longirostris, (Hodgs.) Moore, P. Z. S. (1854), p.

A. B. Nepal (No. 892, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

Pyc. longirostris. Forehead, crown, nape, back, rump, upper tail-coverts, and tail rufous brown, darkest on the crown, wings, and tail, the last distinctly rayed; chin, throat, base of lower mandible, middle of belly, and vent white; car-coverts, sides of the neck, and breast pale rufescent, brightening on the flanks, thighs, and under tail-coverts; under wing-coverts also rufescent; bill black, yellowish beneath at base; legs pale horny. Length  $8\frac{1}{4}$  in., of wing  $2\frac{3}{4}$  in., tail  $3\frac{1}{4}$  in., bill to frontal plumes  $\frac{5}{8}$  in., to gape 1 in., height from chin to front  $\frac{2}{10}$  in., tarse 1 in., middle toe and claw  $1\frac{1}{10}$  in., central and lateral ditto  $\frac{7}{10}$  in., and hind ditto  $\frac{7}{10}$  in.

This bird may possibly be the species noticed (but not described) by Mr. J. W. Frith in the J. A. S. Beng. XIII. p. 370, as being

<sup>\*</sup> It may here be mentioned in connection with this genus, that Mr. Hodgson, in P. Z. S. (1845), p. 24, refers the species sinensis only to his genus Pyctorhis, and not the bird named rufifrons, as quoted by many authors, which is there described as an Actinodura, it being synonymic with the species previously described by Mr. Gould under the name of Act. Eyertoni.

found in Bengal, which he states "differs from the common species in being about half larger."

Genus Stachyris, Hodgs. (p. 232).

670. STACHYRIS RUFICEPS, Blyth.

Stuchyris ruficeps, Blyth, J. A. S. Beng. XVI. p. 452 (1847); Cat. B. Mus. A. S. Beng. p. 150. Bonap.,
C. G. Av. p. 332. G. R. Gray, Gen. of Birds, 111.
App. p. 10. Moore, P. Z. S. (1854), p.

The Rufous-headed Stachyris.

A. b. c. d. Nepal (No. 923, Hodgs, Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

St. rufteeps. Allied in form and size to St. pyrrhops, but having the crown light ferruginous, and the chin and middle of the throat white, with slight black central streaks to the feathers; rest of the upper parts plain olive, and of the lower whitish, with a fulvous tinge on the sides of the neck and breast; [in some specimens, the crown and nape is bright ferruginous, and the whole under parts pale ferruginous;] bill and legs pale horny. Length  $4\frac{1}{3}$  in., of wing  $2\frac{1}{3}$  in., tail 2 in., bill to frontal plumes  $\frac{1}{10}$  in., to gape  $\frac{1}{10}$  in., and tarse  $\frac{1}{3}$  in.

Genus Pycnonotus, Kuhl (p. 238).

671. PYCNONOTUS NIGROPILEUS, Blyth.

Pycnonotus nigropileus, Blyth, J. A. S. Beng. XVI. p. 472 (1847); Catal. B. Mus. A. S. Beng. p. 209. Bonap., C. G. Av. p. 265.

A. b. Tenasserim. From Helfer's Collection.

"This species differs from *P. hæmorrhous* in having no black on the throat and breast, which are brown, with greyish margins to the feathers, like the back; and the whole nape and back are much paler than in *P. hæmorrhous*; the under tail-coverts crimson, and the cap alone being black."—(Blyth.)

Dr. Helfer, in his MSS, notes, states that "this bird is very common about habitations throughout the Tenasserim provinces."

Genus Microtarsus, Eyton (p. 248).

672. MICROTARSUS CANTORI, Moore.

Microtarsus Cantori, Moore, P. Z. S. (1854), p.

A. Malacca. Presented by Dr. Cantor, 1854.

**M. Cantori.** The head, back, rump, and shoulders of an olive-green colour; wings dusky ferruginous on the outer webs, and margined with olive-green, coverts rufous olive-green; tail rufous, paler beneath, the feathers of the rump copious; flanks dusky, with a broad yellowish-white tip to most of the feathers; throat white; the breast brownish-grey; fore part of abdomen white, tinged with yellow, the latter colour becoming brighter on the vent and under tail-coverts bill and feet dark horn-colour. Length  $7\frac{1}{4}$  in., of wing  $3\frac{5}{8}$  in., tail  $3\frac{5}{4}$  in., bill to gape  $\frac{7}{8}$  in., and tarse rather more than  $\frac{1}{2}$  in.

Quite distinct from the bird to which the name of M. olivaccus has been given.

This may possibly be a state of plumage of the female of *M. melanoleucos*, Eyton.

Genus Criniger, Temm. (p. 252).

673. CRINIGER CANTORI, Moore.

Criniger Cautori, Moore, P. Z. S. (1854), p.

a. b. Malacca. Presented by Dr. Cantor, 1854.

C. Cantori. Crown deep ash, the feathers brown at base, paler on the nape, and passing to yellowish olive-green on the back, rump, and shoulders; wings rufous brown, edged with olive-green; tail rufous brown, edged paler; lores, ear-coverts, and sides of neck pale ash; base of lower mandible and throat white; rest of the under parts bright yellow; bill horny above, pale below; feet yellowish. Length  $7\frac{1}{4}$  in., of wing  $3\frac{1}{2}$  in., tail  $3\frac{1}{4}$  in., bill to gape  $\frac{1}{10}$  in., and tarse  $\frac{1}{4}$  in.

The nuchal hair-like barbs are well developed in this species. Like C. gularis, Horsfield, it is not crested.

Genus Phyllornis, Boie (p. 258).

### 674. PHYLLORNIS CYANOPOGON, Temm.

Phyllornis cyanopogon, Temm., Pl. Col. 512, f. 1. Blyth, Cat. B. Mus. A. S. Beng. p. 213. G. R. Gray, Gen. of Birds, I. p. 124. Bonap., C. G. Av. p. 396. Cabanis, Cat. Mus. Heine, p. 114.

Phyllornis moluccensis, J. E. Gray, Zool. Misc. (1832), p. 33. Strickl., P. Z. S. (1846), p. 100; Ann. Nat. Hist. XIX. p. 130.

Phyllornis malabaricus, apud Blyth, J. A. S. Beng. XII. p. 957.

Phyllornis cochinchinensis, apud Raffles, Trans. Linn.

Soc. XIII. p. 309; Blyth, J. A. S. Beng. XIV. p. 565. Moore, Cat. Birds Mus. E. I. Compy. p. 260.

Burong Daun, Sumatra, Raffles.

A. B. & Q. Sumatra. Presented by Sir T. S. Raffles.

c. J. Pinang. Presented by Dr. Cantor, 1854.

#### 675. PHYLLORNIS MYSTICALIS, Swainson Sp.

Chloropsis mysticalis, Swains., 24 Cent. p. 296 (1838) (young).

Phyllornis malabaricus, Temm. (nec. Gmel.), Pl. Col. 512, f. 2.

Phyllornis icterocephalus, (Temm.) Bonap., C. G. Av. p. 396 (1850). Cabanis, Cat. Mus. Heine, p. 114.

Phyllornis eyanopogon, apud Blyth, J. A. S. Beng. XIV. p. 564.

A. B. c. 3 9. Malacca. Presented by Dr. Cantor, 1854.

Genus Ixulus, Hodys. (p. 262).

#### 676. IXULUS OCCIPITALIS, Blyth.

Siva occipitalis, Blyth, J. A. S. Beng. XIII. p. 937 (1844).
 Ixulus occipitalis, Blyth, J. A. S. Beng. XIV. p. 552;
 XVI. p. 448; Cat. B. Mus. A. S. Beng. p. 100.
 Moore, P. Z. S. (1854), p.

A. Nepal (No. 955, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.

I. occipitalis. "Colour dull brownish olive-green above, the shafts of the dorsal and scapulary feathers pale; below much lighter, and rufescent; the throat whitish, the feathers of the fore neck having dark shafts; crown, nape, and lower tail-coverts ferruginous-brown, which also tinges the flanks; coronal feathers considerably clongated, and the occiput beneath the crest white; bill black; legs yellowish-brown. Length about 5 in., of wing  $2\frac{1}{2}$  in., tail 2 in., bill to gape  $\frac{9}{16}$  in., and tarse  $\frac{7}{8}$  in."—(Blyth.)

### 677. IXULUS CASTANICEPS, Moore.

Ixulus eastaniceps, Moore, P. Z. S. (1854), p.

A. Afghanistan. From Griffith's Collection.

I. castaniceps. Colour above dull brownish olive, the shafts of the dorsal and scapular feathers pale; crown dark chestnut, and subcrested, the frontal plumes short and scaly, and having pale margins; the occiput pale chestnut; behind the eye whitish; car-coverts chestnut; wings blackish, the secondaries and tertiaries having pale shafts; axillaries white; tail black, the three outer feathers graduated, and tipped obliquely externally with white, the next white at the extreme tip only, and the rest entirely black; the whole under parts are of a dirty ruddy-white colour; bill reddish brown; legs yellowish. Length  $5\frac{\pi}{4}$  in, of wing  $2\frac{\pi}{10}$  in., tail  $2\frac{\pi}{4}$  in., its outermost feather  $\frac{\pi}{8}$  in. less, bill to front  $\frac{\pi}{40}$  in., to gape  $\frac{\pi}{4}$  in., and tarse  $\frac{\pi}{4}$  in.

Genus Erythrosterna, Bonap. (p. 287).

678. ERYTHROSTERNA ERYTHACA, Blyth.

Erythrosterna crythaca, Blyth, J. A. S. Beng. XVI. p. 126 (1847).

A. Malacca. Presented by Dr. Cantor.

E. erythaca. "Closely allied in form and structure to E. leucura, Gmel., but the whole throat, breast, and fore part of the abdomen bright yellowish-ferruginous; two narrow whitish bands across the wings, formed by the tips of the coverts; and the white on the sides of the base of the tail much reduced (as compared with E. leucura), occupying only the extreme base of the outermost tail-feathers, and successively increasing in quantity upon the next four; belly and lower tail-coverts pure white; the flanks fulvous-brown; behind the eye, a whitish spot; a slight olivaceous tinge on the upper parts generally; and the tertiaries margined with whitish. Length nearly 5 in., of wing  $2\frac{\pi}{8}$  in., tail  $1\frac{\pi}{8}$  in., bill to gape  $\frac{\pi}{16}$  in., and tarse the same."—(Blyth.)

Genus Abrornis, Hodgs. (p. 341).

679. ABRORNIS? HODGSONI, Moore.

A. b. c. Nepal (No. 899, Hodgs. Catal.). Presented byB. H. Hodgson, Esq., September, 1853.

A. Hodgsoni. Colour above, olive-green, yellowish on the rump; forehead and crown deep ferruginous; infra-orbital plumes blackish, tipped with white; above and below the eyes, ear-coverts, and sides of the neck grey; throat and breast greyish-white; abdomen bright

yellow; wings dusky, margined with ferruginous olive-green; tail dusky, the two outer feathers on the whole of the inner web white, the rest margined with olive-green; bill horny, yellowish beneath; legs yellowish. Length 4 in., of wing 2 in., tail  $1\frac{\pi}{4}$  in., bill to frontal plumes  $\frac{\pi}{16}$  in., to gape  $\frac{\pi}{12}$  in., width at base  $\frac{\pi}{12}$  in, tarse  $\frac{\pi}{12}$  in., middle toe and claw  $\frac{\pi}{12}$  in., hind ditto  $\frac{\pi}{2}$  inch.

July 27th, 1854

# APPENDIX No. II.

Specimens added to the Museum during the printing of the Catalogue; also Corrections and Additions of Synonymes, Native Names, &c.

- 7. Add specimen c. Malacca. Presented by Dr. Cantor, 1854.
- 10. Keeshee, Kumaon, Madden.
- 12. Add specimens c. d. Nepal (No. 891, Hodgs. Cat.). Presented by B. H. Hodgson, Esq., September, 1853.
- 14. SEEAP BELANG, Pinang, Cantor. Add specimens e. Malacca, f. Pinang. Presented by Dr. Cantor, 1854
- 21. Add specimen i. Nepal (F. thermophilus, Hodgs.). Presented by B. H. Hodgson, Esq.
- 24. Ditto b. c. Nepal (F. rufipedoides, Hodgs.). Presented by B. H. Hodgson, Esq.
- 26. Ditto c. d. Nepal (No. 50, Hodgs. Cat.). Presented by B. H. Hodgson, Esq.
- 27. Ditto f. Nepal. Presented by B. H. Hodgson, Esq.
- 35. This is Elanus minor, Bonap., C. G. Av. p. 22. Elanus melanopterus, of India and Malasia, Auctorum. It will stand as Elanus minor, Bonap. Add specimen f. Pinang. Presented by Dr. Cantor, 1854.
- 37. Add specimens d. e. Pinang. Presented by Dr. Cantor.
- 38. Ditto d. Pinang. Presented by Dr. Cantor.
- 39. Ditto f. Pinang. Presented by Dr. Cantor. This is believed to be Falco cirrhatus, Gmelin.
- 46. Ditto h. Pinang. Presented by Dr. Cantor.
- 49. This is Melierax Polyzonus, Rüpp., Falco polyzonus, Rüpp., Melierax musicus, apud Kaup. M. musicus, Daud, is a distinct species.

- 52. Astur barbatus, Eyton, Ann. Nat. (1845), p. 327, is probably a state of plumage of this species.
- 57. DAPHENI, Nepal, Hodgson.
- 65. Add specimens d. adult, e. nestling. Pinang. Presented by Dr. Cantor, 1854.
- 66. This bird was from Malacca. Presented by W. Griffith, Esq. Add specimen b. Malacca. Presented by Dr. Cantor.
- 67. Add specimen e. Nepal (H. albipes, Hodgs.). Presented by B. H. Hodgson, Esq.
- 68. Ditto d. e. f. ! Pinang. Presented by Dr. Cantor. Kohassa, Hind., Blyth.
- 69. Ditto l. Pinang. Presented by Dr. Cantor.
- 72. Krishna Chura ('Black-crested'), Hind., Blyth.
- 73. This is Falco (Lophotes) Reinwardtii, Schlegel et Müller, Verh., Naturl. Gesch. t. 5; Falco Forstenii, Temm., Mus. Lugd.; Lophastur Jerdoni, Blyth, J. A. S. Beng. XI. p. 464; Falco sumatrensis, Lafr.; Avicida Reinwardtii, Bonap., C. G. Av. p. 20. It will stand as Baza Reinwardtii, Schl. et Müller Sp.
- Add specimens c. d. Nepal (No. 727, Hodgs. Cat.). Presented by B. H. Hodgson, Esq.
- 75. KHUKUSAT, Upper Provinces, Blyth.
- 77. Add specimens b. c. Nepal (No. 486, Hodgs, Cat.). Presented by B. H. Hodgson, June, 1853.
- 79. Ditto e. Keddah (Malayan Peninsula). Presented by Dr. Cantor.
- 80. Ditto e. f. Pinang. Presented by Dr. Cantor. This species should be separated from the genus Athene, and arranged as Ninox scutulatus.
- 83. Ditto i. j. k. Malacca, Pinang, and Province Wellesley. Presented by Dr. Cantor.
- 86. Ditto c. Malacea. Presented by Dr. Cantor.
- 90. Ditto d. c. (adult et jun.). Pinang. Presented by Dr. Cantor. In syn. Strix ceylonensis, Lath., insert nec. Gmel. in brackets.
- 92. Ditto g. Nepal. Presented by B. H. Hodgson, Esq.
- 96. Ditto d. e. f. Pinang. Presented by Dr. Cantor. Burong Antoo, Pinang, Cantor.
- 98. Add syn. Strix flammea, Blyth, Cat. Birds Mus. A. S. Beng. p. 41; LARKI Or IAKKI PENCHA, Beng., Blyth; KAREYA Or KURAIL, Hind., vulgò BOOREE CHOOREE, Jerdon; JILEI, Bhagulpore, Blyth.

- 99. This is correct, and will stand as Strix capensis, A. Smith, S. Afr. Quart. Journ. (1836), p. ; Ill. S. Afr. Zool. t. 45. G. R. Gray, Gen. of Birds, I. p. 41; Cat. B. Brit. Mus. p. 110. Bonap., C. G. Av. p. 55.
- 102. Add specimen b. Pinang. Presented by Dr. Cantor, 1854.
- c. d. Nepal (No. 827, Hodgs. Cat.). Presented Ditto 103. by B. H. Hodgson, Esq.
- 104. h. i. Specimens from Nepal. Presented by B. H. Hodgson, Esq., June, 1853. ATEDAN, Sindh, Blyth.
- 105. q. h. Specimens from Malacea. Presented by Dr. Cantor, April, 1854.
- 106. Add syn. Merops bicolor, Bodd.; ? Merops Latreillei, Vieill.; ? Merops cyanopygius, Less., Tr. d'Orn. p. 238. Specimens b. c. from Pinang. Presented by Dr. Cantor, April, 1854.
- 108. Add as syn. Merops Leschenaultii, Vieill. Specimens c. d. e. from Pinang. Presented by Dr. Cantor, April, 1854.
- 110. This is not M. variegatus. Vieill., but M. Lafresnayii, Guerin. Rev. Zool. (1843), p. 322. G. R. Gray, Gen. of Birds, L. p. 86. Bonap., C. G. Av. p. 163.
- 111. Add syn. Alcomorops paleazureus, Less. Rev. Zool. (1840), p. 262. Add specimen d. Nepal. Presented by B. H. Hodgson, Esq.
- 112. Specimens k. l. m. n. from Malacca. Presented by Dr. Cantor, April, 1854. In syn. H. javanica, crase Latham and Shaw's reference, which applies to H. domicola, Jerdon.
- 122. Specimens f. g. from Nepal (No. 962, Hodgs, Catal.). Presented by B. H. Hodgson, Esq., September, 1853.
- 125. Specimen c. from Bengal. Presented by Captain R. C. Tytler.
- 129. In syn. Macropteryx longipennis, alter t. 74 to 47.
- 131. Erase the syn. Podargus stellatus, Gould, which is a distinct species (vide App. p. 388). The name should be javanensis, not javensis.
- 132. Erase specimens d. e. from Assam, which prove to be C. albonotatus, Tickell. Add specimens d. e. f. from Pinang. Presented by Dr. Cantor, April, 1854; q. Malacca. From Griffith's Collection.
- 133. Add A. Nepal (C. saturatior, Hodgs.). Presented by B. H. Hodgson, Esq., June, 1853; b. Malacea. Presented by Dr. Cantor, April, 1854. Transfer specimens a. b. c. to C. albonotatus (vide App. p. 389), d. to C. macrourus.
- 136. Specimen C. Nepal (C. gymnopus, Hodgs.). Presented by B.

- H. Hodgson, Esq., June, 1853. f. Bengal. From Dr. Falconer's Collection.
- 137. Specimen f. from Dacca. Presented by Captain R. C. Tytler.
- 140. Specimens e. f. from Malacca. Presented by Dr. Cantor, 1854.
- 141. Specimens d. e. f. from Malacca. Presented by Dr. Cantor.
- 142. c. d. e. Specimens from Malacca. Presented by Dr. Cantor.
- 143. c. d. Specimens from Nepal. Presented by B. H. Hodgson, Esq., June, 1853.
- 146. f. g. Specimens from Malacca. Presented by Dr. Cantor. Syn. Erolla nasica, Less.
- 147. e.f. Specimens from Pinang. Presented by Dr. Cantor.
- 148. Add specimen d. Nepal. Presented by B. H. Hodgson, Esq. e. Pinang. Presented by Dr. Cantor.
- 149. d. e. Specimens from Malacca. Presented by Dr. Cantor. Genus Halcyon (p. 123), erase the syn. Todiramphus.
- 151. h. Malacca. Presented by J. Gould, Esq. (1853). i. Malacca. Presented by Dr. Cantor.
- 153. d. e. Pinang. Presented by Dr. Cantor.
- 155. This is the same as No. 154. It will stand as H. smyrnensis.Add specimen e. Pinang. Presented by Dr. Cantor.
- 158. Separate this from the genus *Haleyon*, and place it under the genus *Todiramphus*.
- 161. Erase the query to syn. Alcedo nigricans, which Mr. Blyth states is the young of euryzona, the adult of which is A. grandis, Blyth, J. A. S. Beng. XIV. p. 190; XV. p. 11; XXII. p. 409.
- 162. Add specimens e.f. Pinang. Presented by Dr. Cantor.
- 163. Ditto d. e. f. Malacca. Presented by Dr. Cantor.
- 164. This will bear the prior name of A. beryllina, Vieill., N. Dict. d'Hist. Nat. XIX. p. 414 (1818); Dict. des Sci. Nat. Ornith. t. 63, f. 2. Cassin, Cat. of Haley. in Acad. Nat. Sci. Phil. (1852). Alcedo Beryllina, Vieill. Sp.
- 165. Specimen h. Keddah. Presented by Dr. Cantor. In the reference to Hamilton's MSS., correct vol. I. to II.
- 168. For Kaddehooba read Raddehooba (i. e. 'Cotton thief'), Ceylon, Layard. Ginihoora (i. e. 'Fire thief'), Ceylon, Layard.
- 169. Erase specimens b. c. which are T. paradisi. Add specimens b. c. d. e. Malacca. Presented by Dr. Cantor. In the reference to the J. A. S. Beng. it is vol. XVI. not XVII.

- Genus Hemipus, add as syn. MYIOLESTES, Cabanis, Cat. Birds Mus. Heine, p. 67 (1850).
- 174. Add syn. Myiolestes obscurus, Caban., Cat. B. Mus. Heine, p. 67.
- 177. Add specimen c. Malacca. Presented by Dr. Cantor.
- 178. Add specimens e. f. Malacca. Presented by Dr. Cantor, 1854.
- 182. Add as syn. Perierocotus sordidus, Hodgs., Gray's Zool. Misc. (1844), p. 84. Erase the syn. and specimen P. affinis, ♀, (Horsf.) McClell., which is the ♀ of P. solaris, Blyth (vide App. p. 393). Add specimens d. c. ♀. Assam. From McClelland's Collection. g. ♂. Nepal (No. 947, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.
- 183. Add specimen g. h. ♀. Assam (P. affinis, ♂, McClell.). From McClelland's Collection.
- 184. Erase the syn. *P. igneus*, Blyth, which is a much smaller bird than *P. wanthogaster*, the latter being  $6\frac{1}{2}$  in. long, wing  $3\frac{2}{8}$  in., and tail 3 in.
- 186. Add specimens b. c. Q. Assam, d. J. Keddah. Presented by Dr. Cantor.
- 187. Ditto c. d. e. Pinang. Presented by Dr. Cantor.
- 189. Ditto c. d. Nepal (No. 932, Hodgs. Cat.). Presented by B. H. Hodgson, Esq., September, 1853.
- 190. Type of the genus Sauloprocta, Cabanis, Cat. Birds Mus. Heine, p. 57 (1850).
- 192. Add specimen i. Malacca. Presented by Dr. Cantor.
- 193. Kunicu and Kal Kolacui, Sindh, Blyth.
- 195. Add specimen b. Dacca. Presented by Captain R. C. Tytler. c. d. e. f. Pinang. Presented by Dr. Cantor.
- 199. Add specimen b. Java. From Dr. Horsfield's Collection.
- 201. This belongs to the genus Lanius, and will stand as L. divaricatus, Raffles.
- 203. Type of the genus Dissemurus, Gloger (1842). Caban., Cat. Birds Mus. Heine, p. 111. Add specimens e. f. Pinang. Presented by Dr. Cantor.
- 204. Type of the genus Trichometorus, Cabanis, Cat. B. Mus. Heine, p. 112 (1851). In syn. *Edolius barbatus*, add p. 34.
- 208. d. young. From Griffith's Collection. e. Dacca. Presented by Captain R. C. Tytler.
- 212. e. Specimen from China. Presented by John Reeves, Esq.
- 214. Transfer specimens A. B. to L. tephronotus. Add specimens a. b. c. From Griffith's Collection. Native name LATORA PILA MUTTRA, Blyth.

- No.
- 217. B. C. Specimens from Madras and Assam. e. Afghanistan. From Griffith's Collection.
- 218. i. Specimen from Pinang. Presented by Dr. Cantor, April, 1854. Erase the syn. Lanius arcnarius, Blyth, which is separated as a species (vide App. p. 394).
- 219. e. f. g. h. Specimens from Pinang. Presented by Dr. Cantor, April, 1854. Add as syn. ! Lanius ferox, Drapiez, Diet. Class.
- 220. Transfer this genus to Subfam Pariana (vide p. 375).
- 221. This is not Eur. anguitimens, Smith, but Eur. Rüppelli, Bonap., Rev. Zool. (1853), p. 440; Eur. anguitimens apud Rüpp. Syst. Uebers, p. 23, t. 27, the true anguitimens being from S. Africa.
- 222. h. Specimen from Dacca. Presented by Captain R. C. Tytler.
- 223. b. Ditto from Malacca. Presented by Dr. Cantor, April, 1854.
- 225. Add as syn. *Thamnocataphus senilis*, Tickell, J. A. S. Beng. XVIII. p. 813. Blyth, Cat. B. Mus. A. S. Beng. App. p. xxi. Add specimens *d. e. f.* & \( \varphi\). Nepal (No. 895, Hodgs. Catal.). Presented by B. H. Hodgson, Esq., September, 1853.
- 233. Add specimens h. i. Pinang. Presented by Dr. Cantor. Syn. Pycnonotus humeraloïdes, Læsson; Saxicola orientalis, Vieill.; Sylvia leucophaa, Vieill.
- 236. Syn. Pycnonotus carbonarius, Less., Rev. Zool. (1841), p. 226-N.B. It is doubtful whether this is C. fimbriatus, Temm.; if not, it will stand as C. silens, Tickell (1833). Erase the specimen from Tenasserim, which is C. avensis, Blyth (vide App. p. 394).
  - Genus Tesia (p. 179), add as syn. Anura, Hodgs. (1841).
- 240. Add syu. Pnoëpyga (Tesia) concolor, Hodgs. Gray's Zool. Misc. (1844), p. 82; also add specimen e. (P. unicolor, Hodgs.) from Nepal.
- 241. Add syn. *Pnoëpyga (Tesia) pusilla*, Hodgs. Gray's Zool. Misc. (1844) p. 82.
- 244. Add specimens c. d. e. of  $\, {\bf \hat{z}} \,$  . Malacca. Presented by Dr. Cantor.
- 247. Erase the native name Sintar, and also Raffles's specimen, which is *P. Boschi*, Müll. et Schleg. (vide App. p. 398).
- 248. Add specimens B. C. D. Pinang. Presented by Dr. Cantor.
- 250. Add specimens B. C. D. E. Malacca. Presented by Dr. Cantor.
- 253. Erase specimen e. from Afghanistan, which is P. longirostris, Blyth (vide App. p. 400).
- 254. Add specimens C. D. J. Tenasserim. From Helfer's Collection.

- No
- 256. Add specimen D. (young). Kumaon. From Capt. R. Strachey's Collection. Krishen Pattii, Nepal, Hodgson.
- 258. Type of the genus Тиампоцља, Cabanis, Cat. B. Mus. Heine, p. 8 (1850).
- 261. Specimens of this bird were sent home by Mr. Blyth, under the MSS. name of T. hyperythrus.
- 267. 'Add specimens E. f. (young.) Darjeeling. From Pearson's Collection.
- 274. Ditto C. China. Presented by John Gould, Esq. Erase the specimen from Madras, which is *M. simillima*, Jerd.
- 275. Add specimens  $f, g, g \in \mathbb{R}$  . Kumaon. From Capt. R. Strachey's Collection.
- 285. Add specimen B. Tenasserim. From Helfer's Collection.
- 304. Ditto B. China.
- 307. Syn. Actinodura rufifrons, Hodgson, P. Z. S. (1845), p. 24.
- 309. Transfer this genus to subfam. *Paradoxornina* (vide App. p. 377).
  - Genus Sibia, add as syn. Malacias, Cabanis, Cat. B. Mus. Heine, p. 113 (1851).
- 314. Add syn. *Malacias capistratus*, Cabanis, Cat. B. Mus. Heine, p. 113.
- 315. For *Malacocircus*, read Malacocercus. Add specimen B. Madras. Presented by John Gould, Esq.
- 316. Add specimen C. Dukhun. Presented by Colonel Sykes.
- 318. Ditto e. Dacca. Presented by Captain R. C. Tytler.
- 324. Ditto c. d. Malacca. Presented by Dr. Cantor, 1854.
- 325. Ditto c. d. Malacca. Presented by Dr. Cantor.
- 326. Syn. ? Napothera pileata, Müller, Mus. Lugd. Bonap., C. G. Av. p. 359.
- 327. To syn. Napothera coronata, Müll., add Mus. Lugd. Bonap., C. G. Av. p. 358.
- 328. Syn. Napothera rubicauda, Müll., Mus. Lugd. Bonap., C. G. Av. p. 359.
- 329. This is a species of *Trichastoma*, and will stand as *Trichastoma* sepiaria, Horsf., Sp.
  - Genus Timalia, add as syn. NAPODES, Cabanis, Cat. B. Mus. Heine, p. 77 (1850).
- 332. Add syn. Napodes pileata, Cabanis, Cat. B. Mus. Heine, p. 77.
- 334. Add specimens d. e. Malacca. Presented by Dr. Cantor.
- 335. Ditto d. c. Malacca. Presented by Dr. Cantor.
- 336. Add specimen d. Malacca. Presented by Dr. Cantor.

- Ño.
- 337. Add specimens c. d. e f. Malacca. Presented by Dr. Cantor. Add syn. Formicivora gularis, Menetries, Mem. de l'Acad. Imp. des Sci. de St. Petersb. I. p. 514; Myiothera gularis, Voigt. das Thierr. I. p. 494.
- 339. Pyctorhis was published in 1844, Chrysomma in 1845; therefore, this will stand as Pyctorhis sinensis. Erase the syn. Pyctorhis rufifrons, which is a synonym of Actinodura Egertoni (vide App. p. 408).
- 354. Type of the genus Otocompsa, Cabanis, Cat. B. Mus. Heine, p. 109 (1851). Syn. Leos erythrotis, Bonap. Consp., Gen. Av. p. 265 (1850). Add Malayan variety (with a much shorter subocular tuft of a deeper crimson colour). a. b. c. d. Pinang (Le. erythrotis, Bonap.). Presented by Dr. Cantor.
- 355. Add specimen g. young. Dacca. Presented by Captain R. C. Tytler.
- 356. Ditto e. young. Madras. From Wight's Collection.
- 359. Ditto b. c. Shikarpore. From Griffith's Collection.
- 360. Add syn. Otocompsa leucogenys, Cabanis, Cat. B. Mus. Heine, p. 109.
- 361. Type of the genus Loedorusa, Reichenb. (1850). Cabanis,
  Cat. B. Mus. Heine, p. 109. Add specimens c. d. e. Pinang.
  From Dr. Cantor's Collection.
  d. Malacca. From Griffith's Collection.
- 362. Add syn. Otocompsa flavirictus, Cabanis, Cat. B. Mus. Heine, p. 109.
- 367. Type of the genus Sphagias, Cabanis, Cat. B. Mus. Heine, p. 110 (1851).
- 371. ZURD BULBUL, Beng. Dr. F. (B.) Hamilton, MS. II. p. 89. PAHARIGA KANGDHARA, Gorakpore. Ditto. Add specimen d. Tenasserim. From Helfer's Collection.
- 372. In syn. Malacopteron aureum, correct vol. XIV. to XVI. Add specimens c. d. Pinang. Presented by Dr. Cantor, 1854.
- 373. Type of the genus Prosecusa, Reichenb. (1850). Cabanis, Cat. B. Mus. Heine, p. 110. Add specimens d. e.f. Malacca. Presented by Dr. Cantor.
- 374. Add specimens d. e. f. y. h.  $\beta$  (adult et jun.). Malacca. Presented by Dr. Cantor. i.  $\mathfrak{P}$  (?)
- 381. Syn. Pycnonotus rufocaudatus, Eyton, Ann. Nat. Hist. XVI. p. 228. Erase the syn. Ixos phæocephalus, Hartl., and Trich. caniceps, Lafr.
- 385. This is considered distinct from the genus Criniger, being the

- type of the genus Tracurcomus, Cabanis, Cat. B. Mus. Heine, p. 109 (1851). Add specimens e. f. Pinang. Presented by Dr. Cantor, 1854.
- 391. Add specimens c. d. Malacca. Presented by Dr. Cantor.
- 395. Ditto c. J. Afghanistan. From Griffith's Collection.
  d. Dacca. Presented by Captain R. C. Tytler.
- 397. This is not *P. cochinchinensis*, but *P. cyanopogon*, Temm. (vide App. p. 410).
- 398. Add specimens D. jun. Java. (*P. viridis*, Horsf.). From Dr. Horsfield's Collection. *e.* \(\varphi\). Sumatra. (*P. zosterops*, Vig.). From Sir T. S. Raffles's Collection. *f. g.* \(\varphi\). Malacca. Presented by Dr. Cantor. Mirba-daus, Malays, Eyton.
  - Genus *Yuhina*, add as syn. Odonterus, Cabanis, Cat. B. Mus. Heine, p. 113 (1851).
- 399. Add syn. Odonterus gularis, Caban., Cat. B. Mus. Heine, p. 113.
- 400. Add syn. Odonterus occipitalis, Caban., Cat. B. Mus. Heine, p. 113.
- 407. Add specimens d. e. Q. Malacca. Presented by Dr. Cantor.
- 408. Ditto  $g.\ h.\ \$  Malacea. Presented by Dr. Cantor.
- 410. Ditto e.f. of 9. Pinang. Presented by Dr. Cantor.
- 415. Ditto e.f. ♂. Pinang. Presented by Dr. Cantor.
- 421. For Malayensis read Malayana.
- 423. Add specimens d. e. f.  $\eth$   $\circ$ . Pinang. Presented by Dr. Cantor.
- 425. Ditto e.f. g. & Q. Pinang. Presented by Dr. Cantor.
- 428. Ditto c. J. S. India. Presented by the Asiatic Society of Bengal.
- 429. Ditto c. Nepal. Presented by B. H. Hodgson, Esq.
- 430. This is Sylvia pammelina, Stanley, Trav. in Abyss., App. p. lix. (1811). Lath., Gen. Hist. VII. p. 95; Saxicola melæna, Rüpp., Faun. Abyss. t. 28, f. 2; Thamnobia melæna, G. R. Gray, Gen. of Birds, I. p. 185. Bonap., C. G. Av. p. 298. Pentholwa melæna, Cabanis, Cat. B. Mus. Heine, p. 40 (1850). It will stand as Pentholwa Pammelina, Stanley Sp.
- 432. Add specimen a. Q. Pinang. Presented by Dr. Cantor.
- 449. Genus Hypothymis, Boie, is distinct. This species will come under the genus Eumytas, Cabanis, Cat. B. Mus. Heine, p. 53 (1850). GLAUCOMYTAS, Cabanis, being co-equal. It will stand as Eumyias indigo, Horsf. Sp.
- 450. This will stand as Eumyias albicaudata, Jerd. Sp.
- 451. This will stand as *Eumyias melanops*, Vigors Sp. Add as syn. *Glaucomyias melanops*, Cabanis, Cat. B. Mus. Heine, p. 53.

- No.
- 455. Specimen c. 3. Nepal (No. 419, Hodgs. Cat.). Presented by B. II. Hodgson, Esq.
- 461. Ditto b. Nepal. Presented by B. H. Hodgson.
- 465. In note at bottom, for 140 read 142.
- 470. No. 404 Hodgs. Catal.
- 471. Nos. 403, 405 Hodgs. Catal.
- 474. Add specimens d. e. Assam. From McClelland's Collection.
- 484. It is not certain whether this is *succica*, Linn.; if not, it will bear Hodgson's name of *succicoïdes*.
- 492. Add specimen h. Pinang. Presented by Dr. Cantor, 1854. Genus *Prinia*, add as syn. Daseocharis, Cabanis, Cat. B. Mus. Heine, p, 45 (1850).
- 493. Add syn. Dascocharis familiaris, Cabanis, Cat. B. Mus. Heine, p. 45.
- 507. Specimen b. c. Shikarpore. From Griffith's Collection.
- 524. Ditto c. S. India. Presented by the Asiatic Society of Bengal.
  - Genus Reguloïdes, add as syn. Pyllobasileus, Cabanis, Cat. B. Mus. Heine, p. 33.
- 538. Add syn. Phyllobasileus proregulus, Cabanis, Cat. B. Mus. Heine, p. 33.
- 567. Add syn. Anthus cuonyx, Cabanis, Cat. Birds Mus. Heine, p. 14 (1850).
- 577. In the description, for atrogularis read Huttoni.
- 597. Type of the genus Масиловорииs, Cabanis, Cat. B. Mus. Heine, p. 91 (1850).
- Add syn. Machlolophus spilinotus, Cabanis, Cat. B. Mus. Heine, p. 91.
- 599. Add syn. Machlolophus melunolophus, Cabanis, Cat. B. Mus. Heine, p. 91.
- 600. Add syn. Machlolophus rubidiventris, Cabanis, Cat. B. Mus. Heine, p. 91.
- 606. This is separated from the genus Orites, and forms the type of the genus ÆGITHALISCUS, Caban., Cat. B. Mus. Heine, p. 90 (1850). It will stand as Ægith. erythrocephalus, Vigors Sp.
- 607. This will stand as Agithaliscus leucogenys, Moore Sp.
- 608. This will stand as Agithaliscus (?) jouschistos, Hodgs. Sp.
- 673. This has been previously described as *Ixos phaiocephalus*, Hartl., Rev. Zool. (1844) p. 401, and as *Trichophorus caniceps*, Lafr., Rev. Zool. (1845), p. 367. It will stand as Criniger Phaiocephalus, Hartl. Sp.
